Introduction

This edition of the Data Summary and Problem Analysis documents and analyzes traffic impact problems that occurred during 1989 within the State of Washington. An abbreviated version of this document is used for the Problem Analysis section of the Traffic Safety Commission's 1991-1992 Highway Safety Plan.

Impact problems consist of factors that contribute directly to the occurrence of collisions, fatalities, and/or injuries. They are identified and analyzed to make possible the design and implementation of countermeasures against their negative effects.

Problem areas were selected based on statewide experience of impact areas (where information was available) as outlined in the federal safety standards. Various statewide automated and manual traffic information systems were inventoried and analyzed. The data sources included: Traffic Accident Records, Fatal Accident Reporting System, Driver's Licensing Records, Vehicle Registration Records, and Highway/Roadway Information. In most instances, data from previous years were gathered as a baseline to serve as a point of comparison to the current year.

Statewide traffic collision records were the primary source for identifying the specific traffic problem areas. Collision experience from prior years served as a baseline in analyzing the traffic collision data. This baseline provided a perspective to assess the current year's (1989) experience with traffic problem areas. The baseline also serves to identify short-term changes in collision patterns as distance from longer-term trends.

The development of over/under-representation ratios was the primary method of analysis. Where relevant exposure data were available, the generation of over-representation ratios allow for the comparisons of different subgroups relative to the percentage of the population they comprise. Additionally, counties and cities were ranked by different problem areas to compare geographical and political subdivisions.

Traffic Problems Selected for Analysis

An overview plus the following traffic safety problem areas were selected for this year's analysis:

- Alcohol Involvement
 - Youth Involvement
 - Safety-Restraint Usage
 - Motorcycle Collisions
 - Pedalcycles
 - Pedestrians
 - Heavy Trucks
 - Pupil Transportation
 - Contributory Driver Violations
 - Senior Driver Involvement
 - Vehicle Defects
-

I. Overview

The number of persons killed on Washington's highways in 1989 totaled 781, a 2.4% increase from the 1986-1988 three-year baseline average of 763. The total number of fatal collisions increased 0.9% in 1989 compared to the average for 1986-1988. Injury collisions and total number of persons injured also increased in 1989 by 6.8% and 7.3% respectively over the three-year averages in those categories. Property-damage-only collisions showed very little change over the previous three years (Table 1-1).

Table 1-1

SEVERITY OF COLLISIONS Four-Year Comparison						
Impact	Year				Previous 3-Year Average	% of Change 89 - 3-Year Average
	1989	1988	1987	1986		
Total Collisions	128,800	125,920	126,807	122,918	125,215	2.9%
Fatal Collisions	694	706	699	658	688	0.9%
Total Killed	781	785	790	714	763	2.4%
Injury Collisions	50,747	49,482	46,968	46,090	47,513	6.8%
Total Injured	73,993	72,449	67,665	66,707	68,940	7.3%
Property Damage Only Collisions*	77,359	75,732	79,140	76,170	77,014	0.4%

* Oct. 1, 1987 the reporting level for motor vehicle traffic collisions increased from \$300 to \$500. Fatal and injury collisions were not affected by this change in the law, but property damage only collisions were reduced by 4.3% in 1988.

Source: WSP

A. Exposure

Motor vehicle travel increased by 11.8% in 1989 as compared to the 1986-1988 baseline average. Motor vehicle registration also jumped 7.7% over the baseline while the number of licensed drivers increased 6.4%. In 1989, the state's population increased 3.8% over the 1986-1988 average to a total of 4,660,700 persons (Table 1-2).

Table 1-2

VEHICLES AND DRIVERS Four-Year Comparison						
Exposure	Year				Previous 3 - Year Average	% of Change 89 - 3-Year Average
	1989	1988	1987	1986		
Motor Vehicle Travel*	43,449	41,698	38,520	36,416	38,878	11.8%
Motor Vehicle Registration	4,084,367	3,896,828	3,833,058	3,651,102	3,793,663	7.7%
Licensed Drivers	3,350,324	3,264,065	3,156,600	3,029,375	3,150,013	6.4%
State's Population	4,660,700	4,565,000	4,481,100	4,419,700	4,488,600	3.8%

*in Millions

B. Rates

The 1989 motor vehicle traffic death rate was 1.80 fatalities per 100 million vehicle miles - the lowest in the state's history. The rate was down 8.5% from the previous three-year average and lower than the 1988 rate of 1.88, the previous record low. The rate of 1.70 injuries per one million vehicle miles in 1989 was also down from the 1.74 rate for 1988 (Table 1-3).

Table 1-3

Source: WSP, WSDOT						
DEATH AND INJURY RATES Four-Year Comparison						
Rates	Year				Previous 3-Year Average	% of Change 89 - 3-Year Average
	1989	1988	1987	1986		
Death Rate (Deaths per 100M vehicle miles)	1.80	1.88	2.05	1.96	1.96	-8.5%
Injury Rate (Injuries per 1M vehicle miles)	1.70	1.74	1.76	1.83	1.78	-4.1%

C. Fatalities by Status

Drivers were killed more frequently than passengers or others in 1989 motor vehicle collisions. Fatalities in this classification increased from 394 in 1988 to 420 in 1989. The 1989 figure represented an 11.2% increase from the average of the three previous years. The number of passengers killed, however, decreased from 206 to 174, representing a 15.5% reduction from 1988, and down 53, or 10.8%, from the three-year baseline period. The number of motorcyclists killed in collisions decreased to 69 in 1989 (Table 1-4).

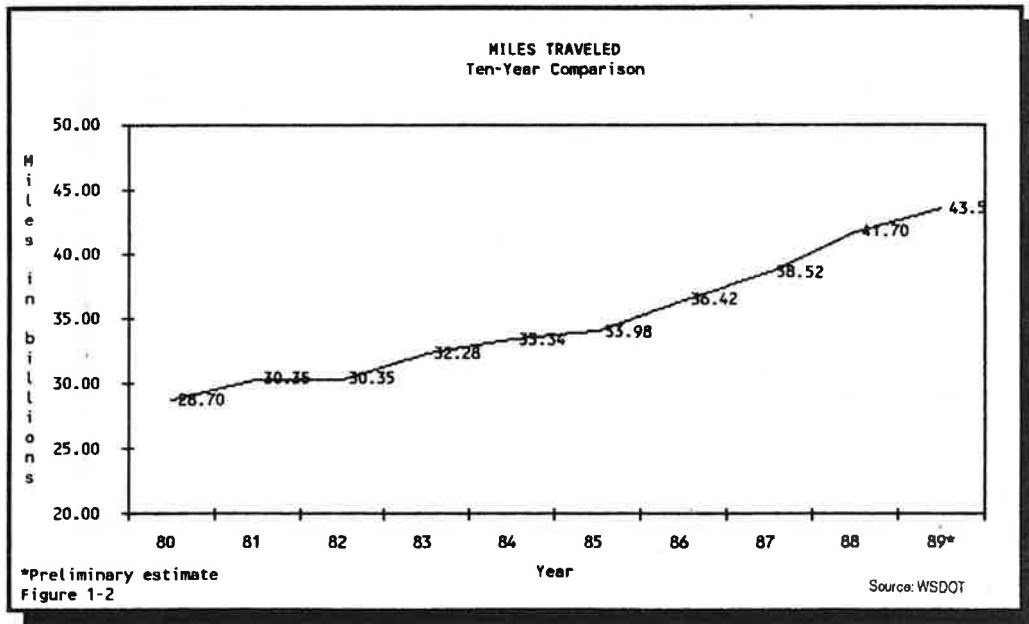

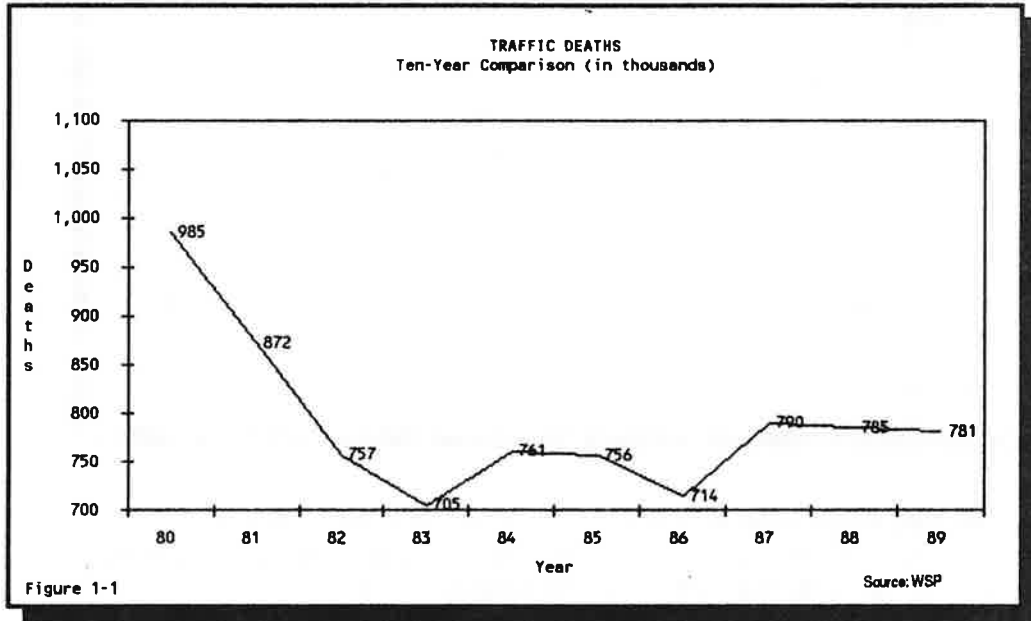

Table 1-4

PERSONS KILLED BY STATUS Four-Year Comparison						
Status	Year				Previous 3-Year Average	% of Change 89 - 3-Year Average
	1989	1988	1987	1986		
Drivers (no motorcyclists)	420	394	386	353	378	11.2%
Passengers	174	206	204	175	195	-10.8%
Pedestrians	110	97	93	94	95	16.2%
Pedalcyclists	8	12	18	12	14	-42.9%
Motorcyclists	69	76	89	80	82	-15.5%
TOTAL	781	785	790	714	763	2.4%

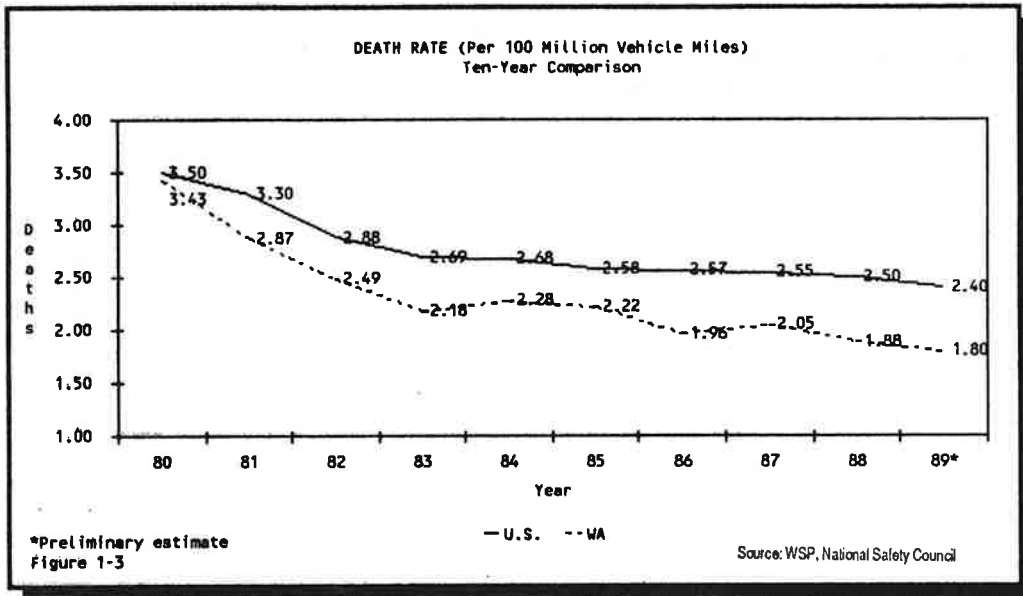

Source: Washington State Patrol

D. Traffic Collisions, Deaths, Injuries, Travel, and Death Rate

After a sharp increase in traffic deaths during 1987, there were slight decreases the following two years with 785 in 1988 and 781 in 1989. Figure 1-1 indicates that total traffic deaths have leveled off during the past three years. The two extremes in recent history of traffic deaths are a high of 1,034 deaths recorded in 1979 and a record low of 705 in 1983. Motor vehicle travel in 1989 increased by 4.2% over 1988 to reach an all-time high of 43.449 billion miles (Figure 1-2).

The state's 1989 traffic fatality rate of 1.80 deaths per 100 million vehicle miles of travel continues to be well below the national rate of 2.40 for the year. The 1.80 rate is the lowest point in Washington's history: it fell from the 1.88 rate recorded in 1988 and was 47.5% below the 3.43 rate recorded at the beginning of the decade (Figure 1-3).

Total reported motor vehicle traffic collisions and injuries increased over the three-year average. Compared to 1988, total collisions and the number of persons injured were up by 2.3% and 2.1% respectively (Figure 1-4).

E. Highways, Travel and Fatalities

The U.S. and state numbered systems (other than the interstate system) were the most-traveled road systems in the state with an estimated 12.231 billion miles traveled. The interstate system continued to have the lowest death rate of all the state systems with a 0.80 rate per 100 million vehicle miles in 1989: a decrease of 0.18 from 1988. Estimated travel on city streets totaled 8.116 billion miles in 1989 with a death rate of 1.18, up very slightly from 1988. County roads were traveled an estimated 10.852 billion miles and recorded a death rate of 2.56 in 1989, a decrease from the previous year's 2.85 rate. Total motor vehicle travel in the state increased from 41.698 billion miles in 1988 to 43.449 billion in 1989 (Table 1-5).

F. Traffic Deaths by County

In 1989, fatalities ranged from a high of 145 in King County, with a death rate of 1.23 (traffic deaths per 10,000 registered vehicles), to a low of 1 death in Asotin County with a death rate of 0.71. Ferry County recorded the highest death rate at 13.07 computed from 5 fatalities, followed by Columbia County that recorded a 9.38 death rate based on 4 traffic deaths. Adams County was third with 13 traffic deaths and a death rate of 9.32 (Figure 1-5).

Figure 1-5

Traffic Deaths Per 10,000 Registered Vehicles by County

G. Collisions by Age Group

Drivers 20 years old and under comprised 7.4% of all licensed drivers in the state last year, yet this age group was involved in 17.4% of the total 1989 collisions. This was a collision over-representation rate 2.35 times higher than the percentage of licensed drivers comprising this group. The 21-24 age group was involved in 12.2% of the total collisions while comprising 7.5% of all licensed drivers, producing an over-representation factor of 1.63. The 25-29 age group, comprising 11.6% of all licensed drivers, was involved in 14.4% of all collisions for an over-representation ratio of 1.24. The 30-34 age group, comprising 12.7% of

all licensed drivers, was involved in 12.7% of all collisions, a 1 to 1 ratio. All other age groups were under-represented when their percentages of collision involvement were compared to their percentages of total licensed drivers (Table 1-9).

Table 1-9

DRIVER DISTRIBUTION By Age Group & Sex

1989

H. Collisions by Type

Multiple-vehicle collisions increased slightly from 94,304 in 1988 to 96,549 in 1989 (Figure 1-8). Single-vehicle collisions also increased slightly (Figure 1-9). Vehicle-pedestrian collisions increased 2.8% from 1988 (Figure 1-10). Vehicle-pedalcycle collisions dropped by 3.3% in 1989, the second year of decrease after a five-year trend of increases in pedalcycle collisions from 1982 through 1987 (Figure 1-11).

II. Alcohol Involvement

In 1989, 11.2% of all drivers involved in investigated traffic collisions had been drinking alcohol. This is a 3.4% decrease from 1988 and continues a downward trend (Figure 2-1).

A. Drivers Involved In Fatal Collisions

In 1989, 35.0% of the drivers involved in statewide fatal collisions had been drinking intoxicants. This decreased from the 40.6% involvement recorded in 1988 and from the 39.1% baseline period (Table 2-1). In injury collisions, 13.4 drivers out of every 100 had been drinking prior to being involved (Table 2-1a, 2-1b)).

Table 2-1

No. drunk drivers per 100 involved	6.6	6.1	6.2	7.9%	6.3%

B. Alcohol Involvement By Age Group

Drivers under 30 years of age continue to be over-represented in alcohol-related collisions. The 16- to 20-year-old group composed 7.3% of all licensed drivers in the state in 1989, but they were involved in 14.5% of all alcohol-related collisions. This age group was involved in nearly two times more alcohol-related collisions than the percentage of licensed drivers it represented by a ratio of 1.97 (Figure 2-2). The over-involvement ratio for drivers aged 21-24 was 2.52 in 1989. This continues a fairly constant over-representation ratio during the past 5 years (Figure 2-3). Last year, the 25- to 29-year age group was involved in 1.8 times more alcohol-related collisions than the percentage of licensed drivers the group represented (Figure 2-4). The age group 30-54 was under represented by a ratio of 0.8 (Figure 2-5), as were the age groups 55-64 by a ratio of .31 (Figure 2-6), and 65 years and older by a ratio of .18 (Figure 2-7).

C. Drivers Involved in Alcohol-Related Collisions

Data for all collision involvement by driver's age and percent of vehicle miles traveled for each age group reveal that the 16-17 year olds have the greatest over-representation in all reported collisions at 4.17. The 18-20 year olds were the second most over-represented group. The age group with the greatest under-representation based on miles traveled was the 55-64 category. Those in the 16- to 17-year-old bracket also displayed the greatest over-representation in alcohol-related collisions based on miles traveled. Second in this ranking was again the 18- to 20-year-old group. The age group 55-64 recorded the greatest under-representation in alcohol-involved collisions with a 0.28 ratio (Table 2-2).

Table 2-2

ALL REPORTED COLLISIONS & ALCOHOL-RELATED COLLISIONS Comparison of Miles Traveled

Table 2-3 presents a summary of the number of persons killed and injured, number of property damage collisions, and total investigated collisions for drivers under the influence (legally drunk), all drinking drivers (had been drinking but not legally drunk), and non-drinking drivers. Of the had-been-drinking driver collisions, there were 9.5% fewer persons killed and 2.6% fewer received disabling injuries. In addition, there were 2.0% fewer "possible injuries." Property-damage-only collisions decreased by 13.9%, while persons with non-disabling injuries increased by 1.5% in 1989. Of the drivers under the influence, persons killed decreased 6.1% compared to last year. All levels of injury severity increased over last year. Property-damage-only collisions recorded a 0.5% increase. Total "DUI" collisions increased 4.0% overall. Alcohol-related (drivers who had been drinking) collisions recorded a 7.2% decrease when compared to the previous year.

Table 2-3

SUMMARY OF PERSONS KILLED & INJURED IN ALCOHOL-RELATED COLLISIONS Two-Year Comparison									
Status	Drivers Under the Influence			Drivers Who Had Been Drinking*			Non-Drinking Driver Collisions***		
	1989	1988	% of Change	1989	1988	% of Change	1989	1988	% of Change

D. DWI Convictions

In 1989, a higher number of convictions for alcohol-related traffic offenses reversed a six-year downward trend that started in 1983. The 15,657 convictions in 1989 for DWI/Physical Control violations still represented a drop of 46.7% from the 29,385 convictions recorded for the year of 1982. The number of DWI drivers involved in investigated collisions last year increased to 9,900, the highest number recorded since 1981 when 11,666 drivers were involved (Figure 2-8).

E. Location of Alcohol-Related Collisions

Alcohol-related collisions increased in rural areas and decreased in urban areas during 1989. In 1989, 55.0% of the alcohol-related collisions occurred in rural areas and 45.0% in urban areas (Figure 2-9).

F. Multiple- and Single-Vehicle Collisions

The predominant type of alcohol-related vehicle collisions continued to be multiple-vehicle mishaps in urban areas (Figure 2-10) and single-vehicle collisions in rural areas (Figure 2-11). In urban areas, 66.1% of the collisions involved two or more vehicles as opposed to only 36.6% on rural roads.

The percentage of all single-vehicle collisions where the driver had been drinking remained relatively stable at nearly half of the total alcohol-involved collisions for 1989. In comparison, single-vehicle collisions represented only 21.5% of the total collisions in 1989 (Figure 2-12). To express the over-representation of alcohol in single vehicle collisions, the percentage of alcohol involvement in single-vehicle collisions is compared to the percentage of single-vehicle collisions in total vehicle collisions. This ratio increased slightly from 2.27 in 1988 to 2.3 in 1989.

Figure 2-12 shows over-involvement of single-vehicle alcohol-involved collisions compared to single-vehicle collisions in total collisions.

G. Weekend Alcohol Involvement

Weekend alcohol-related collisions occurred at a rate that was 1.69 times greater than the overall percentage of weekend collisions (Friday 6 p.m. to Sunday midnight). This over-representation ratio has remained fairly constant over the previous four years (Figure 2-13). A further breakdown compares the percent-

age of alcohol-involved collisions occurring Friday and Saturday between the hours of 8 p.m. to 3 a.m. to the percentage of the total week's collisions occurring in the same time frame; the alcohol-related collisions were more than 3 times over-represented during 1989. This is slightly above the over-representation ratio registered for the previous four years (Figure 2-14).

H. Fatal Alcohol-Involved Collisions Occurring At Night

The ratio of all nighttime fatal collisions involving alcohol to all alcohol-related fatal collisions increased during 1989 as compared to the previous year and to the four-year baseline. All nighttime fatal collisions composed 52.2% of the year's total fatal collisions, while alcohol-related nighttime fatal collisions increased to 73.8% of all nighttime fatalities. Alcohol-related fatal collisions at night over-represent all nighttime fatal collisions by a ratio of 1.42, up from the previous four-year period ratio (Figure 2-15).

I. Ratio of Drinking and Drunk Drivers Involved In Fatal Traffic Collisions by Roadway Type

Of all drivers involved in fatal collisions in 1989, 35% had been drinking prior to the collision. This is a substantial decrease from 40.6% the previous year and down slightly from the previous five-year average of 38.8% (Figure 2-16). Just over eleven percent (11.2%) of the drivers involved in all investigated collisions had been drinking prior to the collision; a considerable drop from the 18.2 percent reported in 1981. Also recording a significant decrease (-25.4%) during the 8-year period was the number of drivers found to be under the influence while involved in traffic collisions. During last year, however, the ratio of DUI drivers

involved in traffic collisions compared to all drivers involved went up from 6.1 drivers per 100 in 1988 to 6.6 in 1989 (Figure 2-17).

Figure 2-17

Source: WSP

The total frequency of particular blood alcohol concentration (BAC) levels in fatal and serious injury collisions for 1989 by age group is presented in Table 2-4. The 16-20 and 21-24 age groups evidenced the greatest incidence of involvement for .05-.19 BAC levels. At the .10-.14 BAC range, the 21-24 age group had the greatest frequency of occurrences. At the .15 through the .29 BAC levels, the 25-29 age group had the greatest frequency of occurrences. Overall, the 16-20, 21-24, 25-29, and 30-34 age groups displayed the highest incidence of involvement at all BAC levels.

Table 2-4

Age	Alcohol Level							Test Given No Results	Test Refused	Total Tested

Source: WSP

An analysis of roadway type by day of week on which alcohol-involved fatal and serious injury collisions occurred is given in Table 2-5. County roads accounted for 35.7% of the total weekly collisions compared to 27.5% for city streets. U.S. and state routes totaled 26.6% while the interstates contributed to 8.9% of the weekly total of fatal and serious alcohol-involved collisions during 1989. The table also reveals that during this period of time, Saturday was the day with the greatest frequency of fatal and serious injury collisions involving alcohol. Sunday and Friday were the next highest days in that order (Figure 2-18).

Table 2-5

FATAL & SERIOUS INJURY COLLISIONS INVOLVING ALCOHOL Roadway Type by Day of Week

Table 2-6 depicts the number of persons killed and injured by drivers "under the influence" and who "had been drinking" by month for 1987, 1988, and 1989. The last four months of 1989 recorded the highest incidence of persons injured for both categories of alcohol-involved drivers, with the exception of the month of July. During July, 864 persons were injured by drivers "under the influence" and 1,335 persons were injured by drivers who "had been drinking."

Table 2-6

PERSONS KILLED & INJURED IN ALCOHOL-RELATED COLLISIONS BY MONTH Three-Year Comparison												
Month	Drivers "Under the Influence"						Drivers Who "Had Been Drinking"					
	Persons Killed			Persons Injured			Persons Killed			Persons Injured		
	1989	1988	1987	1989	1988	1987	1989	1988	1987	1989	1988	1987

III. Youth Involvement

During 1989, youthful drivers 24 years and younger were involved in 58,410 reported collisions, of which 268 were fatal collisions and 25,209 were injury collisions. This was a 4.7% decrease in reported collisions and an 8.8% decrease in fatal collisions, but a 2.8% increase in injury collisions compared to the four-year baseline. There were 496,433 licensed drivers 24 years old and younger in 1989, up slightly from the baseline period. The total collision rate (total collisions per 1,000 licensed drivers) of 11.77 for 1989 was down slightly from the 12.20 rate for the baseline average (Table 3-1).

Table 3-1

YOUTHFUL DRIVERS (24 YEARS & YOUNGER) INVOLVED IN COLLISIONS Five-Year Comparison							
Collisions & Rates	Year					Previous 4-Year Average	% of Change 89 - 4-Year Average

A. Youthful Drivers Involvement In Collisions By First Harmful Event

In 1989, 74.1% of those drivers age 24 years and younger involved in collisions collided with other moving vehicles. This type of collision also resulted in the greatest percentage of fatal collisions (47.0%) and injury collisions (72.0%). Single-vehicle collisions with fixed objects led to the second highest percentage of youthful driver involvement in total, fatal and injury collisions at 15.1%, 26.9% and 16.2% respectively (Table 3-2).

Table 3-2

Source: WSP						
COLLISIONS INVOLVING YOUTHFUL DRIVERS By First Harmful Event						
Type of Collision	Total Collisions		Fatal Collisions		Injury Collisions	
	Number	% of Total	Number	% of Total	Number	% of Total
Collision with other moving motor vehicles	38,493	74.7%	117	47.0%	15,922	72.0%
Collision with parked vehicle	1,772	3.4%	5	2.0%	454	2.1%
Collision with fixed/other object	7,801	15.1%	67	26.9%	3,590	16.2%

Collisions with pedestrians & pedalcyclists	672	1.3%	22	8.8%	648	2.9%
Other collisions - animal & R.R. train	303	0.6%	2	0.8%	66	0.3%
TOTAL	51,507	100.0%	249	100.0%	22,127	100.0%

B. Youthful Collision Involvement By Age Group

The 16- to 20-year-old age group was involved in 17.4% of all collisions. This group's over-representation ratio dropped from 2.41 in 1988 to 2.36 in 1989. However, it is still the highest over-representation ratio for any age group (Figure 3-1). The 21- to 24-year-old age group slightly decreased its over-representation ratio from 1.65 in 1988 to 1.63 in 1989 (Figure 3-2). The 25-29 age group posted an over-representation ratio of 1.24, up from the previous year's 1.24 (Figure 3-3). The 30-54 and 55-year-old-and-older age groups continued to be under-represented in total collisions compared to the groups' percentages of all licensed drivers (Figure 3-4 and 3-5).

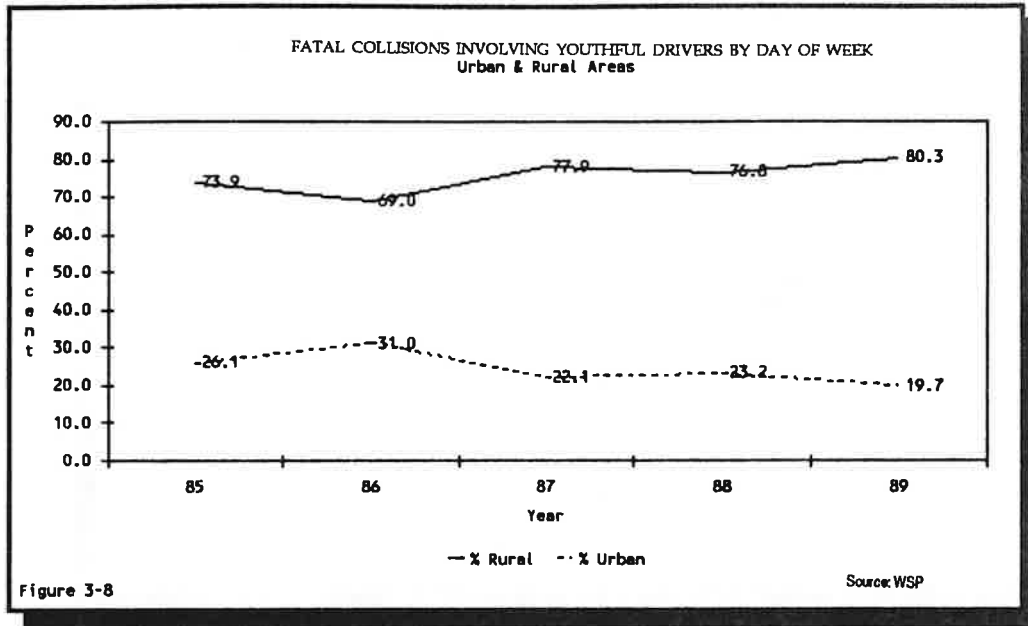

C. Collision Severity By Area For Youthful Drivers

In 1989, the urban and rural area collision mix remained virtually unchanged, with the urban areas recording 57.4% of collisions involving youthful drivers (24 years old and younger) and the rural areas recording 42.6% (Figure 3-6). Youthful driver injury collisions in urban areas increased slightly to 54.1%, while the rural areas decreased accordingly (Figure 3-7). Youthful driver fatal collisions continued to be far more common in rural areas. In 1989, 80.3% of the fatal collisions involving youthful drivers occurred in rural areas, higher than the 76.8% recorded in 1988 and higher than the 1985-1988 average of 74.4%. The urban areas recorded 19.7% of the fatal crashes, down from 23.7% the year earlier (Figure 3-8).

D. Youthful Driver Involvement By Time

In 1989, 25.5% of all the rural fatal collisions involving youthful drivers occurred on Saturday. Sunday had the next highest percentage with 19.5%. The highest frequencies of all reported collisions occurred on Friday and Saturday, each recording 17% of the week's total collisions (Figure 3-9). In urban areas Sunday had the highest occurrence of fatal crashes involving youthful drivers (20.4%). Friday recorded 19.4% of the urban total collisions for 1989, while Monday recorded the fewest collisions (6.1%). Note the significant increases throughout the week, Monday through Sunday, in total urban collisions (Figure 3-10).

In rural areas, the greatest percentage (19.0%) of youthful driver involvement in fatal collisions occurred from midnight to 3 a.m.. The greatest percentage of total collision involvement (23.9%) for these drivers in rural collisions was from 3 p.m. to 6 p.m. (Figure 3-11). In the urban areas, the greatest youthful involvement by time period in fatal collisions was 24.5% from 9 p.m. to midnight followed by 20.4% in the midnight to 3:00 a.m. time period. The 3 p.m. to 6 p.m. time period recorded 27.4% of the youthful drivers involved in total urban collisions (Figure 3-12).

IV. Safety-Restraint Use

Out of a total of 197,394 occupants involved in total investigated collisions, 159,592 were using safety restraints. This is a usage rate of 80.8%, which marks the eighth consecutive year of increases in safety-restraint use since 1981, when the usage rate in investigated collisions was 15.9% (Table 4-1).

Table 4-1

RESTRAINT USAGE RATE Five-Year Comparison										
Status	1989	%	1988	%	1987	%	1986	%	1985	%
Restraints Used	159,592	80.8%	161,667	80.0%	152,413	77.6%	102,751	54.5%	60,392	35.1%
No Restraints Used	37,802	19.2%	40,387	20.0%	44,081	22.4%	85,669	45.5%	111,885	64.9%
TOTAL	197,394	100.0%	202,054	100.0%	196,494	100.0%	188,420	100.0%	172,277	100.0%

Note: Usage rate is the percent of occupants using the restraints among all occupants involved in collisions for whom the usage is known.

Source: WSP

Last year, 395 occupants who were not using any type of restraint died and 2,776 non-restrained occupants were seriously injured. Based on 1989 investigated collision data, it is estimated that an occupant who does not "buckle up" is ten times as likely to be killed and over four and one half times as likely to be seriously injured than one who does "buckle up" (Table 4-2).

Table 4-2

RESTRAINT USAGE & INJURIES SUSTAINED*								
Type	Restraints Used		Child Restraints**		No Restraints		Total Occupants	
	Number	%	Number	%	Number	%	Number	%

*Excludes cases where injury severity was not stated or where restraint use was unknown.

Source: WSP

**Included with Restraints Used Category.

A. Restraint Use by Sex and Age

In 1989 collisions, 86.0% of the female drivers used their restraints, while 81.4% of the male drivers used theirs. Female passengers used restraints at a rate of 79.0% compared to 71.9% for male passengers. The 0-5 age group had the highest restraint use of any age group at 85.8%. The age group with the lowest usage rate was the 16-19 year olds at 74.8%. All age groups showed slight increases in the usage rate, with the exception of the 0-5 age group which recorded a decrease from the previous year (Tables 4-3 and 4-4).

Table 4-3

USAGE RATES BY SEX*

B. Restraint Use by Driver Occupation

The usage rate of safety restraints by occupation of driver ranges from a high of 95.6% for law officers to a low of 62.6% for farmers and farm laborers. Usage rates for all occupations with the exception of the military, house wife/domestic, and farmer showed modest increases for 1989 (Figure 4-1).

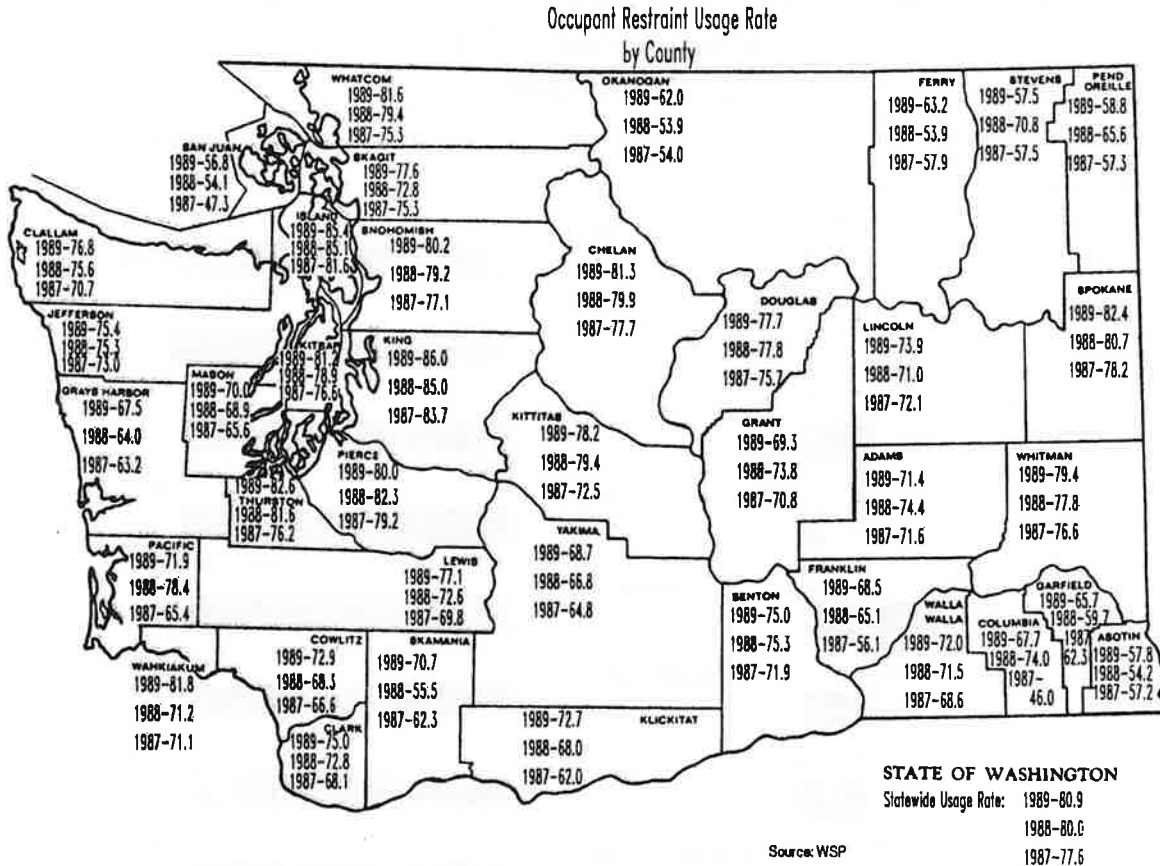

Figure 4-1

C. Restraint Use by County

A graphic depiction of restraint use by county is presented in Figure 4-2. King County, at 86.0%, had the highest usage rate of all counties in the state in 1989. Island County had the next highest usage rate at 85.4%. The three counties with the lowest usage rate was San Juan, Stevens, and Asotin Counties, recording usage rates of 56.8%, 57.5%, and 57.8% respectively.

Figure 4-2

D. Restraint Use by Road and Vehicle Type

Freeway travel (interstates) had the highest usage rate by vehicle occupants at 87.0%. Occupants of vehicles traveling on all other roadways, including forest service roads and recreational roads that are open to the public, recorded the lowest usage rate at 60.9%. The Occupant usage rate in 1989 increased on all types of roadways, with the exception of the "All Other Roadway" category which recorded a 3.1% decrease (Table 4-6).

Table 4-6

Source: WSP, WSDOT					
RESTRAINT USAGE By Functional Class of Roadway					
Functional Class	1989	1988	1987	1986	1985
Interstate	87.0%	86.5%	84.6%	66.8%	49.6%
Other state routes	81.5%	79.8%	82.0%	56.0%	34.9%
County Roads	75.9%	75.0%	72.5%	50.5%	31.6%
City Streets	81.5%	80.7%	77.9%	52.6%	32.1%
All others	60.9%	64.0%	63.6%	41.8%	29.7%

Examination of safety-restraint use by vehicle type reveals modest increases in usage rates for all types of vehicles. Passenger cars recorded the highest usage rate at 82.1%. The classification of all other vehicles recorded the lowest rate at 73.2%. However, this group showed the largest increase of restraint use in 1989 (Table 4-7).

Table 4-7

Source: WSP, WSDOT					
RESTRAINT USAGE RATE BY TYPE OF VEHICLE DRIVERS Five-Year Comparison					
Type of Vehicle	1989	1988	1987	1986	1985
Passenger car	82.1%	81.6%	78.9%	56.6%	36.8%
Light Trucks	78.0%	76.2%	73.1%	48.8%	29.8%
Heavy Trucks	75.8%	71.7%	67.7%	49.9%	27.3%
All others	73.2%	68.3%	69.5%	52.9%	34.6%

In 1989, 94.3% of the occupants were using safety restraints in "other government (federal agency) registered vehicles" involved in collisions. The next highest usage rate was the 87.4% reported for "municipal government registered vehicles." Occupants of county registered vehicles had the lowest usage rate of occupants in all government owned vehicles at 80.7%. Usage rates by occupants of state-registered vehicles was lower in 1989 (81.0%) than in the previous year (87.8%), but this was the only group that recorded a decrease (Table 4-8).

Table 4-8

Source: WSP, WSDOT					
RESTRAINT USAGE RATE BY TYPE OF GOVERNMENT VEHICLE Five-Year Comparison					
Type of Government Vehicle	1989	1988	1987	1986	1985
State registered vehicles	81.0%	87.8%	93.8%	76.3%	77.4%
County registered vehicles	80.7%	75.8%	78.2%	63.8%	49.5%
Municipal registered vehicles	87.4%	79.4%	85.9%	66.3%	49.9%
Other government registered vehicles	94.3%	93.8%	87.6%	84.1%	68.3%

E. Usage Rate by Proximity

Drivers residing within 15 miles of the collision scene recorded the lowest safety-restraint usage rate at 82.7%. Drivers residing in another state recorded the highest usage rate, 85.4%. All categories continued to record increases in restraint usage over previous years (Table 4-9).

Table 4-9

Source: WSP, WSDOT					
RESTRAINT USAGE RATE BY PROXIMITY OF DRIVER RESIDENCE Five-Year Comparison					
Residence Proximity	1989	1988	1987	1986	1985
Resided within 15 miles of collision	82.7%	81.9%	79.7%	55.5%	35.3%
Resided over 15 miles	84.4%	84.0%	80.4%	58.1%	38.9%
Residing in other state	85.6%	83.4%	79.1%	60.0%	41.3%

F. Restraint Use by Seat Position

An examination of restraint usage by seat position reveals that drivers were the most frequent users at 82.9%. Occupants in the left-back and right-back positions were the next most frequent restraint users at 78.4%. Occupants riding in the mid-front used restraints the least at 57.0% (Table 4-10).

Table 4-10

Source: WSP, WSDOT					
RESTRAINT USAGE RATE BY OCCUPANT SEAT POSITION Five-Year Comparison					
Occupants	1989	1988	1987	1986	1985
Driver	82.9%	82.1%	79.7%	55.9%	35.8%
Mid-front	57.0%	54.8%	51.8%	34.0%	21.2%
Right-front	78.3%	78.0%	74.9%	51.9%	31.9%
Left-back	78.4%	77.7%	74.9%	58.1%	42.6%
Mid-back	68.9%	66.7%	62.4%	44.4%	33.3%
Right-back	78.4%	77.8%	74.1%	58.0%	40.8%
Other	31.6%	29.0%	28.8%	21.5%	20.3%
TOTAL	80.9%	80.1%	77.6%	54.5%	35.1%

Table 4-11 presents 1989 restraint usage by occupant age and seat position. Children aged 0-4 sitting in the right-back and left-back seats recorded the highest usage rate at 92.9% and 91.8% respectively. The 5-9 age group also used safety-restraints most frequently in the left-back (89.3%) and right-front (84.7%) seat positions. The seat position with the lowest reported usage rate for younger groups (20 and under) was the mid-front seat, while the lowest reported usage rate for occupants 21 years of age and older were in the mid-back position. The driver continued to "buckle up" more than any other occupant for those aged 15 through 64. The right-front occupant was the most frequent restraint user at 89.2% in the 65 and over age group.

Table 4-11

Source: WSP, WSDOT								
RESTRAINT USAGE RATE By Occupant Age & Seat Position								
Seat Position	Age							
	0-4	5-9	10-14	15-20	21-24	25-29	30-64	65 & Over

Seat location unknown	68.0	66.5	48.7	57.1	43.9	49.2	50.6	28.6

F. Restraint Use by Severity of Collision

A more detailed breakdown of types of restraints used by injury severity is presented for 1989 in Table 4-12. Of 537 occupants killed in vehicle collisions, 395 (73.6%) were not using restraints. Of the 5,375 persons sustaining disabling injuries by collisions, 51.6% were using no restraints. No injuries were reported in investigated collisions for 65.0% of the occupants who were restrained with the combination lap/shoulder belts, an increase from the 62.2% reported for 1988 and 57.9% reported for 1987.

Table 4-12

TYPES OF RESTRAINTS USED By Severity of Injury												
Type	Number Used		Deaths		Disabling Injury		Evident Injury		Possible Injury		No Injury	
	Number	%	Number	%	Number	%	Number	%	Number	%	Number	%
Lap Belt	29,205	14.8%	18	3.4%	474	8.8%	2,450	12.6%	3,414	12.6%	22,849	15.8%

*Less than 1/10 of 1 percent

Source: WSP

Of all collision-involved drivers in 1989, those who had been drinking displayed a greater tendency not to use restraints than those drivers who had not been drinking. The latter category revealed a restraint-usage rate of 86.1% compared to a usage rate of 46.5% for drivers under the influence and 54.3% for drivers who had been drinking intoxicating liquor (Figure 4-3).

G. Measuring Restraint Use

Historically, restraint usage rates in this state have been calculated and reported based on collision data supplied by investigating enforcement agencies. This data is accurate when based on direct observation by the investigating officer. In some cases, however, the officer must rely on statements of those actually involved in the collision. Since Washington has a mandatory seat belt use law, the human tendency to report compliance with the law (when, in fact, no belt was worn) artificially inflates the usage rate.

Direct observation of seat belt use has become the method of choice among many state and national highway safety agencies. However, because of difficulties in viewing belt use, these rates tend to be artificially low. They are nevertheless considered by national safety leaders to be more accurate than rates based on reported collision data. National goals, such as a 70% usage rate by 1992, are based on observational studies.

Washington State's seat belt usage rate based on investigated collisions is about 80%, while the state's rate based on observational studies is less than 60%. The WTSC will combine its use of observational studies with investigated collision reports in coming years, and will do research into converting to a uniform data base.

V. Motorcycle Collisions

Motorcycle fatal collisions decreased 13.0% in 1989 when compared to the previous four-year baseline average, and 0.3% from the previous year. Total reported collisions decreased at even a greater rate, recording a 24.7% decrease from the baseline average. Registration in 1989 totaled 110,617 motorcycles, a decrease of 9.6% from the baseline period. The motorcycle collision rate of 2.27 for 1989 was down 16.5% from the baseline rate of 2.72 motorcycle collisions per every 100 registered (Table 5-1).

Table 5-1

MOTORCYCLE COLLISIONS SUMMARY Five-Year Comparison							
Collision Severity/Exposure & Rates	Year					Previous 4-Year Average	% of Change 89 - 4-Year Average

**Motorcycle involved per 100 registered

***Fatal Collisions per 1,000 motorcycles registered

A. Motorcycle Collisions By Age Group

The 16- to 29-year-old motorcycle rider continues to be over-represented in the accident population compared to the percentage of licensed motorcycle drivers comprising that age group. The 16-18 year olds were involved in 9.6% of the total collisions, but comprise less than 1% of the motorcycle-endorsed drivers. The 25- to 29-year-old motorcycle riders were involved in the largest percentage of fatal, injury, and total reported collisions (22.2%, 18.7%, and 19.0% respectively). However, they made up only 13.2% of the licensed operators with motorcycle endorsements. From age 30 on up, motorcycle riders are under-represented (Table 5-2).

Table 5-2

Source: WSP, DOL

B. Motorcycle Collisions By Location

Table 5-3 displays a breakdown of motorcycle collision data totals for urban and rural areas as well as statewide for 1989 and 1988. In 1989, rural areas again led urban areas in the total number of fatal collisions, 47 to 23, while urban areas led rural areas in total number of injury collisions, 1,206 to 965. The urban areas of the state recorded a reduction of 5 in the number of motorcyclists killed, down 17.9% from the 28 killed in 1988. Motorcyclist injuries in the urban area increased by 4, while the number of rural injuries dropped 261, or 18.7%, from the previous year.

Table 5-3

Source: WSP						
MOTORCYCLE COLLISIONS BY LOCATION						
Two-Year Comparison						
Severity of Collision	1989			1988		
	Urban	Rural	Statewide	Urban	Rural	Statewide
Total Collisions	1,417	1,099	2,516	1,468	1,305	2,773
Fatal Collisions	23	47	70	25	47	72
Injury Collisions	1,206	965	2,171	1,247	1,146	2,393
Property-damage-only Collisions	188	87	275	196	112	308
Total Fatalities	25	50	75	28	49	77
All Persons Injured	1,485	1,239	2,724	1,481	1,415	2,896
Motorcyclists Killed	23	46	69	28	49	77
Motorcyclists Injured	1,376	1,135	2,511	1,396	1,341	2,737

A further breakdown of 1989 motorcycle collisions by road type indicates that 53.5% of the total collisions, 52.6% of the injury collisions, and 30.02% of the fatal collisions occurred on city streets. County roads accounted for 50% of the fatal collisions and 26.4% each of the injury collisions and the total collisions. All state routes (interstates, U.S. and state routes) recorded 11.4% of the fatal, 19.5% of the injury and 18.8% of the total reported motorcycle collisions (Table 5-4).

Table 5-4

MOTORCYCLE COLLISIONS By Location						
Location	Collisions				Persons	
	Total	Fatal	Injury	P.D. Only*	Killed	Injured

Source: WSP

- *Property Damage Only
- **Excluding city streets
- ***Including U.S. and State Routes in cities

Total frequency of motorcycle collisions occurring on city streets, county roads, and all state routes decreased during 1989. This continues a four-year trend. Motorcycle collisions occurring on state routes continued a downward trend, with an eight-year low of 472 collisions in 1989. County roads also recorded an eight-year low after slight increases in 1985 and 1987 (Figure 5-1).

Figure 5-1

Source: WSP

C. Over/Under Representation of Motorcycle Drivers by Age

Figure 5-2 shows that motorcycle riders under 29 years of age, particularly those 20 years old and younger, continue to be over-represented in total motorcycle collision involvement when compared to the percentages of licensed motorcycle riders comprising their age group. The 30-year-old and over age group continues to be under-represented.

Speed too fast for conditions caused most of the motorcycle collisions for all age groups contributing to 24.1% of the year's motorcycle violations and was the prominent driver violation in all age groups. Driving while intoxicated was the second most prominent violation, contributing 15.4% to total motorcycle driver violations. Motorcyclists driving over the speed limit was the third leading violation, contributing to 13.2% of the violation total (Table 5-5).

Table 5-5

D. Motorcycle Collisions By First Harmful Event

The most common first harmful event causing collisions involving a single motorcycle was overturning. This cause predominated for all age groups. In multiple vehicle collisions involving motorcycles, the rear-end collision was most prevalent (15.3%). Angular collisions constituted the next most common event (13.8%) in multiple vehicle motorcycle collisions. Collisions occurring while entering or leaving a driveway contributed to 12.2% of all motorcycle collisions. (Table 5-6).

E. Time of Motorcycle Collision Occurrence

As one would expect, the milder weather months (June-September) of 1989 recorded the greatest percentage of motorcycle collisions. The highest frequency of fatalities occurred May through October (Figure 5-3).

Friday and Saturday experience the greatest numbers of motorcycle collisions compared to other days of the week. This has been consistent throughout the four-year baseline period and continued in 1989 as well (Figure 5-4).

A further breakdown of motorcycle collisions by hour of day in 1989 reveals that the weekday hours from 2 p.m. to 8 p.m. constituted the most dangerous period of the day. The noon to 1 a.m. time frame proved to be the highest risk period for weekend motorcycling (Figure 5-5).

VI. Pedalcycles

Total pedalcycle accidents decreased 9.4% from the previous four-year average in 1989. The number of pedalcyclists killed decreased from 18 deaths in 1987 to 12 in 1988 and 8 in 1989. The 1989 total was down 40.7% from the baseline period. In addition, fewer persons received injuries than the previous year and from the previous four-year average (Table 6-1).

Table 6-1

*In pedalcycle collisions by first harmful event.

A. Pedalcycle Collisions - Rural/Urban

The rural and urban areas of the state both recorded decreases in pedalcycle collisions. The rural areas recorded the biggest decrease in total collisions and the number of persons injured. The urban areas recorded the largest decrease in the numbers killed (Table 6-1).

In 1989, 69.9% of the pedalcycle collisions occurred in the urban areas of our state, while 30.1% occurred in the rural areas (Figure 6-1).

B. Pedalcyclists Killed and Injured - By Age

In 1989, 37.5% of the pedalcyclists killed were in the 5-9 age bracket (Table 6-2).

Table 6-2

C. Persons Killed and Injured in Pedalcycle Collisions by Month

The months of May through September accounted for 73.6% of the persons killed and injured in pedalcycle-related collisions for 1989. (Figure 6-2).

Figure 6-12

Source: WSP

D. Pedalcycle Collision Rate by City Population

The city of Olympia experienced the highest pedalcycle collision rate in the state during 1989, with 74.03 collisions per 100,000 population. Walla Walla recorded the second highest collision rate in the state with 73.96 collisions per 100,000 population, followed by Aberdeen with 64.18 and Pasco with 62.64 (Table 6-4).

VII. Pedestrians

One hundred and ten pedestrians were killed in 1989, an increase of 17.9% over the four-year average. Pedestrian injuries also increased 2.4% above the four-year baseline to 1,858. In 1989, pedestrian fatalities in rural areas increased by 19, which is 37.3% over the previous year, and were up by 23, which is 49.7% over the four-year baseline period. Injuries decreased by 4 from the previous year, but increased 14 or 2.9% from the baseline period. Urban pedestrian deaths decreased by 7, or 14.0% from the baseline period while pedestrian injuries increased by 30, or 2.3% (Table 7-1).

A. Pedestrians Killed And Injured - By Age

In 1989, 13 more pedestrians were killed than the 97 killed in 1988; 18 more died than the four-year baseline average. The number of pedestrians aged 9 years and younger who were killed decreased from 14 in 1988 to 11 in 1989 and remained unchanged from the previous four-year average. The number of 75 and older pedestrians killed increased by two over the previous four-year average (Table 7-2).

The largest percentage increase for pedestrian injuries during 1989 occurred in the 35-44 and the 10-14 age brackets, the former recording a 16.6% increase and the latter a 15.0% increase in comparison to the baseline average (Table 7-3).

B. Pedestrian Collisions By City Population

Table 7-4 presents the 1989 numbers and rates for pedestrian traffic deaths, injuries, and total collisions for cities of 15,000 population or more in Washington. Auburn had the highest rate of pedestrian fatalities at 9.24 per 100,000 population, based on 3 pedestrian deaths. Comparing pedestrian injury rates, Kent had the highest with 100.40, Lynnwood was second with 95.13, and Seattle was a close third with 94.73. Seattle had the highest rate of pedestrian collisions with 93.12 per 100,000 population; Kent was second with 88.93.

C. Actions Of Pedestrians Killed and Injured - Urban and Rural

Thirty-five percent of the pedestrians killed or injured in urban areas in the state were struck while crossing the roadway at an intersection. Another 40.0% were killed or injured while crossing not at an intersection. The largest percentage of pedestrians in these groups were in the 5 to 14 year olds. Nearly two-thirds (63.8% of the pedestrians ages 0-4 were killed or injured while crossing between intersections).

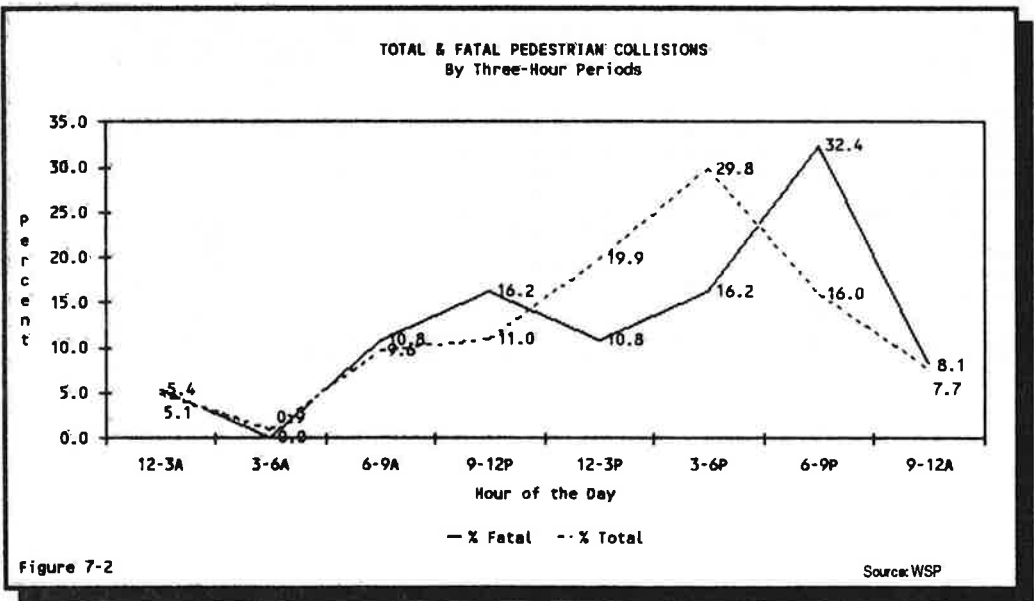

In rural areas, the most frequently involved age group in fatal and injury collisions fell into the 25- to 64-year-old group which accounted for 34.0% of all pedestrians killed or injured in traffic collisions. However, when broken down to single ages, the 5-14 year-olds were the most involved. The most common contributing action of this age group was "crossing, entering roadway not at intersection." Over half (53.4%) of the pedestrians age 5-14 were killed or injured while crossing not at an intersection (Table 7-5).

D. Pedestrian Collisions By Day Of Week and Hour Of Day

In 1989, Friday and Thursday were the two days with the highest frequency of pedestrian fatalities, recording 24.3% and 18.9% deaths respectively. Friday also recorded the highest number of reported pedestrian collisions (Figure 7-1). The 6 p.m. to 9 p.m. time period evidenced the greatest percentage of fatal pedestrian collisions at 32.4%. The 3 p.m. to 6 p.m. recorded the greatest number of reported pedestrian collisions at 29.8% (Figure 7-2).

VIII. Heavy Trucks

In 1989, 6,345 heavy trucks were involved in collisions, for an 12.4% decrease over the four-year baseline. Registrations in 1989 totaled an estimated 112,000 vehicles, a 9.9% increase over the four-year average. Based on this registration figure, the 1989 collision rate was 566.5 collisions per 10,000 registered trucks, a decrease of 20.8% from the four-year average.

There were 79 heavy trucks involved in fatal collisions during 1989, the same as recorded in 1988. This was a 5.0% increase compared to the baseline average. The fatal collision rate was down slightly from the previous year, and down 4.8% from the previous four-year average rate of 7.4 deaths per 10,000 registered trucks.

The estimated registration of heavy trucks has been adjusted for 1989 and the previous years based on updated information on the light/heavy truck registration mix obtained from the Washington Department of Transportation (Table 8-1).

Table 8-1

SUMMARY OF HEAVY TRUCKS Heavy Trucks Involved in Traffic Collisions							
Collision Severity/Exposure & Rates	Year					Previous 4-Year Average	% of Change 89 - 4-Year Average

A. Age of Drivers Involved in Heavy Truck Collisions

The 39-year-old and younger drivers were over-represented in heavy truck collisions compared to the percentage of licensed drivers each group composed. The 19 and under group composed only 0.2% of all licensed heavy truck operators, yet this group was involved in 1.6% of all heavy truck collisions and 2.3% of the heavy truck injury collisions. The ratio for percent of collision involvement com-

pared to percent of licensed drivers composed by the 19 and under age group resulted in an over-representation ratio of 8.35 for this group.

The 20-29 year old age group was involved in 24.1% of the total collisions, 17.3% of the fatal collision and 25.0% of the injury collisions. This group composed 13.1% of all drivers having a classified endorsement on their licenses. Based on the percentage of licensed drivers and collision involvement, this group was over-represented in collisions by a ratio of 1.84.

The 30-39 year-old age group was involved in 32.5% of the total reported collisions and made up 26.7% of the drivers having a classified endorsement on their license. The representation for this group was nearly equal. The rest of the driver age groups were under-represented in total collisions compared to the number of licensed drivers (Table 8-2).

Table 8-2

60 & Over	260	4.5%	7	9.3%	74	4.0%	13.2%	0.34

* Classified Endorsement is required only for operators of the larger trucks and truck combinations

** Percent of collision involvement to percent of licensed drivers

B. Heavy Truck Defects

Defective brakes accounted for 36.7% of the defects detected in heavy trucks involved in collisions in 1989. Other defects included 10.2% worn or smooth tires, 4.8% defective rear lights, 3.2% defective steering, and 41.5% other defects (Table 8-3).

Table 8-3

Source: WSP								
DEFECTS OF HEAVY TRUCKS INVOLVED IN COLLISIONS								
Four-Year Comparison								
Condition of Vehicle	1989		1988		1987		1986

Other Defects	233	41.5%	175	30.0%	222	34.6%	259	33.2%

C. Location of Heavy Truck Collisions By Severity

In 1989, 54.8% of the collisions involving heavy trucks occurred in urban areas (Figure 8-1). There were 22 heavy trucks involved in fatal collisions in urban areas, compared to 57 in the rural areas. These figures compose a 27.8% to 72.2% urban/rural proportion of involvement in fatal collisions (Figure 8-2). The 1989 heavy truck involvement in injury collisions was split, 994 urban to 1,035 rural. These figures represent a 49.0% to 51.0% urban/rural split (Figure 8-3).

D. Heavy Truck Collision Occurrences By Time

The weekdays showed the highest frequency of heavy truck collision involvement, and Friday recorded the single day high. During the weekend, as expected, there was a substantial decline in the frequency of heavy truck involvement in collisions (Figure 8-4).

Last year, the time period from noon to 3 p.m. recorded the highest incidence of heavy truck involvement in collisions. A substantial increase in collisions began during the 6 a.m. to 9 a.m. time period, peaked at the noon to 3 p.m. period, remained high during the 3 p.m. to 6 p.m. period, and then sharply declined (Figure 8-5).

E. Total Collisions - Light Trucks vs. Heavy Trucks

There were 60,842 light trucks and 6,345 heavy trucks involved in collisions in 1989, a 90.6% and 9.4% ratio. This ratio has been shifting toward light trucks every year since 1985 (Figure 8-6).

F. Collisions By First Harmful Event

Heavy trucks were involved in 4,728 collisions involving other moving motor vehicles. This figure represents 74.2% of all heavy truck collisions for 1989.

Heavy trucks also were involved in 412 collisions in which the other vehicle was parked and in 667 collisions with fixed or other objects. Overturning, other non-collisions, and all other collisions accounted for the remaining heavy-truck involved collisions (Table 8-4).

Table 8-4

HEAVY TRUCK COLLISIONS BY FIRST HARMFUL EVENT Four-Year Comparison

IX. Pupil Transportation

During the 1988-89 school year, there were 371 reported school bus collisions in which 216 persons were injured and 1 driver, the driver of the "other" vehicle, was killed. This represented a 16.6% increase over the previous three-year average in total school bus collisions, a 11.0% increase in the number of persons injured, and a decrease of 1 in the number killed. Injuries to pupils riding in the school buses totaled 66 for the 1988-89 school year; down from the 116 reported for the 1987/88 school year and from the three-year average of 68 pupils injured.

There were no fatalities, but 3 major, 19 minor, and 71 possible injuries of school bus occupants during the 1988-89 school year. This was up 1 in the major injury category, but down in the other injury severities from the three-year average.

There were 6,627 registered school buses in the 1988-89 school year. This marked a 6.1% increase in registrations from the baseline period. School bus travel increased 6.41% during the 1988-89 school year compared to the previous three-year baseline period (Table 9-1).

Table 9-1

COLLISIONS INVOLVING SCHOOL BUSES Four-Year Comparison

* Collisions per 1,000 registered vehicles

** Collisions per 100,000 miles traveled

Source: WSP, SPI

During the 1988-89 school year, the school bus mileage collision rate was .50 collisions per 100,000 miles of travel. This rate was up from the 0.43 rate experienced in the 1987-88 school year and the previous three-year baseline (Figure 9-1).

X. Contributory Driver Violations

Driving while under the influence of intoxicating liquor/drugs contributed to 31.9% of the driver violations in fatal collisions and 8.8% of all investigated collisions. Failure to yield right of way contributed to 20.9% of all investigated collisions and 9.1% of the violations in fatal collisions. Exceeding reasonable safe speed contributed to 19.57% of all investigated collisions and 14.0% of the fatal collisions. Exceeding the posted speed was the 3rd ranking driver violation in fatal collisions. It contributed to 4.1% of all investigated collisions. (Figure 10-1).

XI. Senior Driver Involvement

Last year 26,873 senior drivers, 55 years old and older, were involved in 24,896 reported collisions in 1989. There were 158 fatal collisions involving 174 senior drivers and 9,786 injury collisions involving 10,559 senior drivers. This was a 3.5% increase of seniors involved in reported collisions, a 18.2% increase of the number involved in fatal crashes, and a 9.3% increase of those involved in injury collisions compared to the previous four-year baseline period. The number of drivers licenses issued to senior drivers also increased 6.5% from the baseline average to 780,607. The total collision rate (total collisions per 1,000 licensed drivers) of 3.44 for 1989 was down 2.9% from the baseline period (Table 11-1).

Table 11-1

A. Senior Driver Collisions By First Harmful Event

In 1989, 87.3% of the collisions involving senior drivers were "collisions with other moving vehicles." This type of collision also resulted in the greatest percentage of fatal collisions (67.1%) and injury collisions (85.5%). Single-vehicle collisions with fixed objects led to the second largest percentage of senior drivers involvement in total, fatal and injury collisions at 6.1%, 13.3% and 6.7% respectively. While collisions with pedestrians and bicycles comprised only 1.8% of the

total senior driver collisions, 15.3% of the fatal crashes and 4.3% of the seniors' injury collisions were collisions with pedestrians and bicycles (Table 11-2).

Table 11-2

Source: WSP

* Collisions in which one or more senior drivers involved

B. Senior Driver Collision Involvement By Age Group

Failure to yield right-of-way contributed to 47.1% of the total drivers violations for drivers 75 years and older. This violation was also the leading violation for all drivers 55 years and older. This was followed by disregarding traffic control signs and signals for drivers 75 and over. Speed too fast for conditions was the second leading contributing cause for drivers 55 through 74 years of age (Table 11-3).

Table 11-3

*Investigated collisions only

Source: WSP

In 1989, the 55-59 year old group was involved in 6,971 reported collisions for 3.53% of all collisions. This group made up 5.35% of the total number of drivers licensed to drive in this state. The under-representation ratio of 0.66 is nearly the same as the 0.64 ratio reported for the previous year and for the previous four-year baseline average (Figure 11-1).

The 60-64 age group posted an under-representation ratio of 0.58, which was the same as the previous year but up slightly from the previous four-year baseline average (Figure 11-2).

The 65-69 year old group recorded a 0.54 under-representation ratio, a slightly higher representation than in the previous year and in the baseline period (Figure 11-3).

The 70-74 age group recorded a 0.54 under-representation ratio, the same as the baseline average (Figure 11-4).

The last group is the 75 years and older group. This group had a .58 under-representation, down from the baseline ratio of .61 (Figure 11-5).

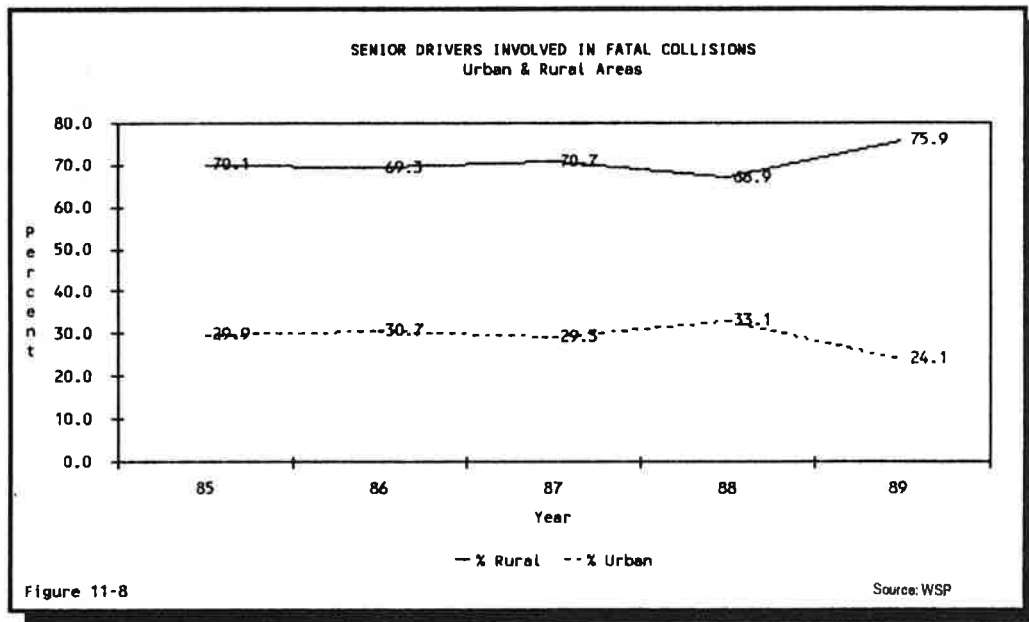

The urban/rural collision ratio involving senior drivers (55 years old and older) remained relatively constant during the past eight years with a 63.2 to 36.8 urban/rural mix for 1989 (Figure 11-6).

The senior driver injury collision urban/rural mix has also remained fairly constant during the past eight years with 60.3% occurring in the urban areas (Figure 11-7).

Senior driver fatal collisions continued to be more common in rural areas; the percentage increased to 75.9% in 1989. Three quarters of all fatal collisions involving senior drivers occurred in rural areas (Figure 11-8).

C. Senior Driver Involvement By Time

Last year, 21.2% of all rural fatal collisions involving senior drivers occurred on Friday, 17.8% occurred on Saturday, and 16.1% occurred on Tuesday. Friday was also the high day of the week for total reported rural collisions, accounting for 17.7% of the senior driver collisions. Thursday followed with 15.6% and Wednesday was next with 15.5% of the collisions (Figure 11-9).

Figure 11-9

Wednesday was the highest fatal collision day, recording 27.5%, followed by Friday with 17.5% of the senior-drivers urban-area fatal collisions. Friday recorded the greatest percentage of urban total reported collisions, 18.6%, for the group (Figure 11-10).

Figure 11-10

In rural areas, the greatest percentage (24.6%) of senior driver involvement in fatal crashes occurred from 12 noon to 3 p.m.. The greatest percentage of total collision involvement (29.6%) for these drivers also occurred from 3 p.m. to 6 p.m. (Figure 11-11).

In the urban areas, the greatest senior involvement in fatal collisions, 30%, was from 3 p.m. to 6 p.m. This same time period recorded 27.5% of the total urban reported collisions of the senior drivers (Figure 11-12).

Figure 11-12

Figure 11-11

XII. Vehicle Defects

In investigated collisions during 1989, only 4.2% of the collision-involved vehicles were found to have contributory vehicle defects. The most common defect was worn or smooth tires, a defect found in 2,165 vehicles. This represented a 25.1% decrease in this category compared to the previous four-year average. Defective brakes, the second most contributory defect, was found on 1,671 collision-involved vehicles in 1989. This was an increase of 11.1% compared to the baseline (Table 12-1).

Table 12-1
