Introduction

The Data Summary and Problem Analysis is a yearly publication which documents and analyzes traffic impact problems in the State of Washington. This 1990 edition outlines factors that contribute to the occurrence of traffic collisions and the resultant fatalities, injuries and property damage.

The analysis of impact problems gives traffic safety program specialists the information needed to design more effective countermeasures. Programs currently implemented are outlined in the biennial Highway Safety Plan published by the Washington Traffic Safety Commission.

The impact problems analyzed in this document identify traffic safety problem areas accounting for the majority of traffic deaths, injuries and property damage. The current year's data is compared to that of recent years for trend identification. Over/under-representation ratios are used to compare the collision involvement of various subgroups relative to their percentage of the population.

Sources of data reported in this document include Traffic Accident Records (Washington State Patrol), the Fatal Accident Reporting System (Washington Traffic Safety Commission), Driver's Licensing Records (Department of Licensing), Vehicle Registration Records (Department of Licensing), and Highway/Roadway Information (Washington State Department of Transportation).

An appendix has been added to this year's document. It includes a glossary of terms, historical information, resource material, and a map of Washington.

I. Overview

Eight hundred and twenty five (825) persons were killed in 726 fatal traffic collisions in the state of Washington during 1990. This was a 5.1% increase in traffic deaths and a 3.8% increase in fatal crashes compared to the previous 3-year average (1987-1989). All reported injuries totaled 76,064, up 6.6% from the previous average. However, disabling injuries and non-disabling injuries recorded decreases of 7.7% and 3.3% respectively. Slight/possible injuries recorded an increase of 17.0% compared to the previous 3-year year average. Total reported collisions increased 3.8% over the same period. Property damage only collisions increased 2.9%, and injury collisions increased 5.4% (Table 1-1).

Table 1-1

| SEVERITY OF COLLISIONS Four-Year Comparison | | | | | | |
|--|---------|---------|---------|---------|-------------------------------|---------------------------------------|
| Impact | Year | | | | Previous 3-Year Average | % of Change 90 - 3-Year Average |

Source: WSP

* Oct. 1, 1987 the reporting level for motor vehicle traffic collisions increased from \$300 to \$500. Fatal and injury collisions were not affected by this change in the law, but property damage only collisions were reduced by 4.3% in 1988.

Exposure

Motor vehicle travel increased 8.4% in 1990 as compared to the 1987-1989 baseline average. Increases were recorded in all other exposure criteria as well, with motor vehicle registration up 7.5%; licensed drivers up 3.4%, and the state's population up 6.5% over the baseline average (Table 1-2).

Table 1-2

| VEHICLES AND DRIVERS Four-Year Comparison | | | | | | |
|--|-----------|-----------|-----------|-----------|---------------------------------|---------------------------------------|

Rates

The 1990 motor vehicle traffic death rate was 1.85 per 100 million vehicle miles traveled; down 3.1% from the 1.91 rate for the 1987-89 baseline average, but up slightly from the all-time low of 1.80 recorded in 1989. The 1990 injury rate of 170.19 injuries per 100 million vehicle miles traveled did reach a record low for our state; it was down 1.8% from the 3-year baseline average and down slightly from last year's record low of 170.3% (Table 1-3).

Table 1-3

Fatalities By Status

More than one-half of all persons killed in traffic crashes were the drivers (438 drivers killed out of 825 total fatalities). Passengers made up the next largest segment with 28.1% of the total, and pedestrians contributed 9.8% of the total. Motorcyclists recorded the largest decrease in deaths compared to previous years and were computed at 7.3% of total deaths (Table 1-4).

Traffic Deaths, Injuries, Travel and Death/Injury Rate

Figures 1-1 through 1-4 depict the trend lines for traffic deaths, miles traveled, death rate and reported collisions and injuries from 1981 through 1990. While motor vehicle travel has increased substantially year by year over the past decade, traffic deaths have varied from a high of 872 deaths in 1981 to a low of 705 in 1983, creating a gradual decline in the death rate from 2.87 in 1981 to 1.85 in 1990. Washington's rate has been consistently lower than the national rate.

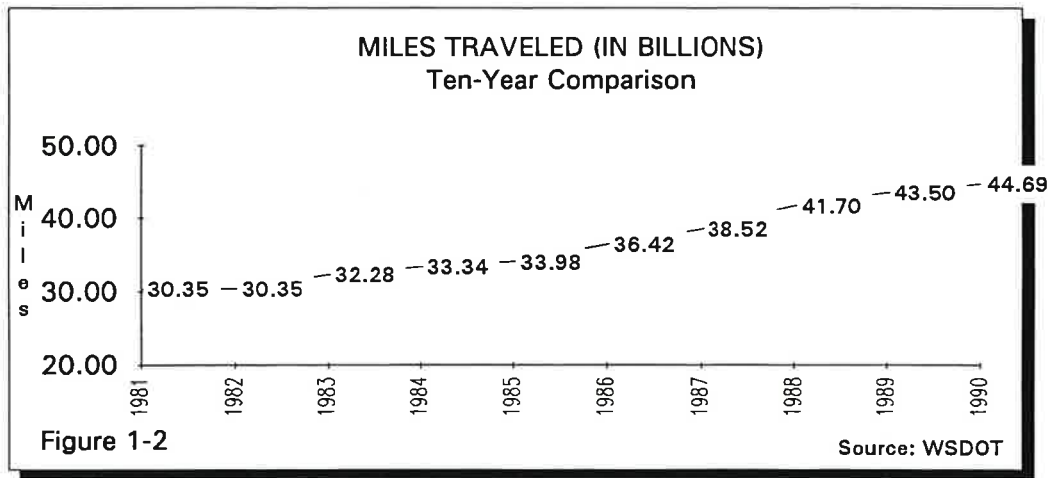

Figure 1-1

Source: WSP

Traffic Deaths and Injuries by Location, Time and Status

The interstate system is the safest of all roadways in the state with a death rate of 0.92 deaths per 100 million vehicle miles in 1990. Travel on the interstate system increased 2.2% over 1989. Twenty eight percent (28.2%) of travel in the state occurred on other state routes with a death rate of 2.58 per 100 million miles of travel. County roads were traveled an estimated 10.852 billion miles and recorded a death rate of 2.72 in 1990, an increase over the previous year's 2.56 rate. Estimated miles on city streets totaled an estimated 8.854 billion miles in 1990 with a death rate of 1.25, up from the 1.18 rate for 1989. Total motor vehicle travel in the state increased from 43.449 billion miles in 1989 to 44.694 billion in 1990, an increase of 2.87% (Table 1-5).

+ Preliminary Estimates

*Fatalities per hundred million vehicle miles, based on roadway travel as reported by WSDOT

**Does not include (all terrain vehicle) trails.

Eighty-one pedestrians were killed and 1,861 were injured in 1990. Older persons (65 and over) contributed to 34.6% of all pedestrians killed; 28.3% of the pedestrians injured were 14 years and younger. Forty-two percent of the pedalcyclists injured were 5 to 15 years (Table 1-6).

* Total injured includes 35 where the status of the injured was unknown.

January and February recorded the biggest increases in traffic deaths in 1990 compared to the previous years: 50% and 60.6% respectively. However, the month of August recorded the highest number of deaths, recording 92, or 27.8% above the previous year (Table 1-7).

Traffic Deaths and Death Rates By County

Fifteen counties recorded a lower death rate than the statewide average of 1.85 deaths per 10,000 registered vehicles. Garfield and Wahkiakum did not record a single fatal crash in 1990, while King County recorded 170 traffic deaths. King County's death rate was below average at 1.28. Ferry County recorded the highest death rate in the state at 21.11, based upon nine deaths (Table 1-8a).

Traffic Safety Statistics: 1972 to 1990

Exposure statistics, which includes total licensed drivers, population, vehicle registration and travel, have increased annually (average increases have been 1% to 5%). Motor vehicle collision and injury totals have followed a similar pattern. The annual traffic death total, on the other hand, has recorded a low of 761 deaths in 1974 to a high of 1,034 deaths in 1979. The fatality death rate (deaths per 100 million miles traveled) has decreased over the years, recording a high rate of 3.82 in 1972 and a low of 1.80 in 1989 (Table 1-8b).

* Estimated for 1990

** Minimum damage for a reportable collision was increased from \$100 to \$300 to the property of one person on 7-1-77 and to \$500 on 10/1/87.

+ State adopted a 90-day fatal-reporting policy in 1980 and a 30-day fatal-reporting policy in 1989.

++ Traffic deaths per 100 million vehicle miles of travel.

Collisions By Age Group

Drivers 20 years and under comprised 6.8% of all licensed drivers in the state last year, yet this group was involved in 14.7% of the fatal crashes and 16.2% of total collisions in 1990. This was a collision over-representation rate of 2.40 for these drivers. The 21-24 age group was involved in 12.0% of the total collisions while comprising 7.5% of all licensed drivers, producing an over-representation factor of 1.59. Senior drivers 55 years and older were involved in 13.79% of the collisions while comprising 22.2% of all licensed drivers, producing an under-representation ratio of 0.62 (Table 1-9).

Collisions By Type

Single-vehicle collisions and vehicle-pedestrian collisions have remained relatively constant over the past seven years, with 27,000 and 1,700 respectively in 1990. Multiple vehicle collisions have increased steadily from 1982 to 1990, recording 99,949 collisions in 1990. Vehicle-pedalcyclist collisions have ranged from a low of 1,056 in 1982 to a high of 1,575 in 1987. There were 1,364 collisions in 1990 (Figures 1-9, 1-10, 1-11).

Collision Rates By County/City Population

Population collision rates ranged from a low of 12.44 collisions per 1,000 population in Asotin County to a high of 41.53 in Kittitas County for 1990. In the cities of 10,000 population and greater, Oak Harbor recorded the lowest rate at 14.21, while the city of Tukwila recorded the highest rate with 134.83. Note: Collisions on the interstate system were not included in the city totals (Tables 1-10, 1-11).

II. Alcohol Involvement

The number of drivers involved in alcohol-related investigated collisions has decreased from 12.3% in 1986 to 10.8% in 1990 (Figure 2-1). Drivers involved in alcohol-related injury collisions decreased from 13.7% during the previous 3-year average to 13.0 in 1990. Drivers involved in fatal crashes, however, increased from the previous 3-year average of 37.3% to 37.9%, a 1.5% increase (Tables 2-1, 2-1b).

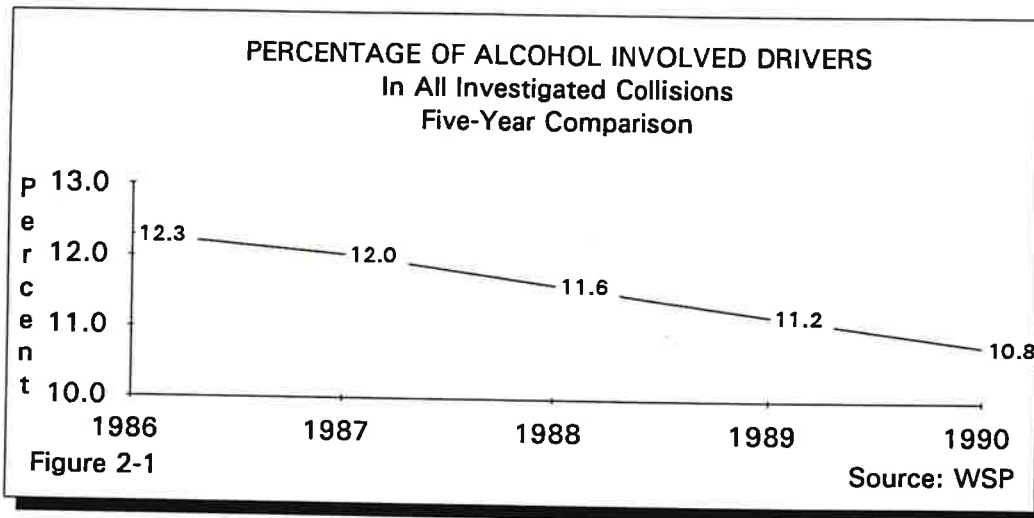

Table 2-1

| Sobriety of Driver | Year | | Previous 3 -Year Average | 1990 Change | |
|---|--------------|--------------|--------------------------|-------------|-----------------|
| | 1990 | 1989 | | From 1989 | From 3-Year Avg |

Alcohol Involvement By Age Group

Drivers under 30 years of age continue to be over-represented in alcohol-related collisions. The 16-20 year old group composed 6.8% of the licensed drivers in the state in 1990, but they were involved in 13.1% of the alcohol-related collisions, creating an over-representation rate of 1.97 (Figure 2-2). The over-involvement ratio for drivers aged 21-24 was 2.35 in 1990, down slightly over the past five years. The age groups of 30-54, 55-64 and 65-and-older were all under-represented (Figures 2-5, 2-6, 2-7).

Collision Severity By Extent of Alcohol Involvement

Table 2-3 presents a summary of persons killed and injured, number of property-damage only collisions, and total investigated collisions for drivers under the influence (legally drunk: BAC of .10 or greater), all drinking drivers (including drunk drivers), and non-drinking drivers. Increases were recorded in all injury categories for 1990 with the exception of disabling injuries for drivers under the influence, and disabling injuries and non-disabling injuries for drivers who had been drinking, and in non-drinking driver collisions (Table 2-3).

Table 2-3

| PERSONS KILLED & INJURED IN ALCOHOL-RELATED COLLISIONS Two-Year Comparison | | | | | | | | | |

DWI Convictions

DWI convictions increased for the second consecutive year after a seven year decrease. DWI drivers involved in investigated collisions has been increasing slightly each year since 1985 (Figure 2-8).

Location of Alcohol-Related Collisions - Multiple and Single

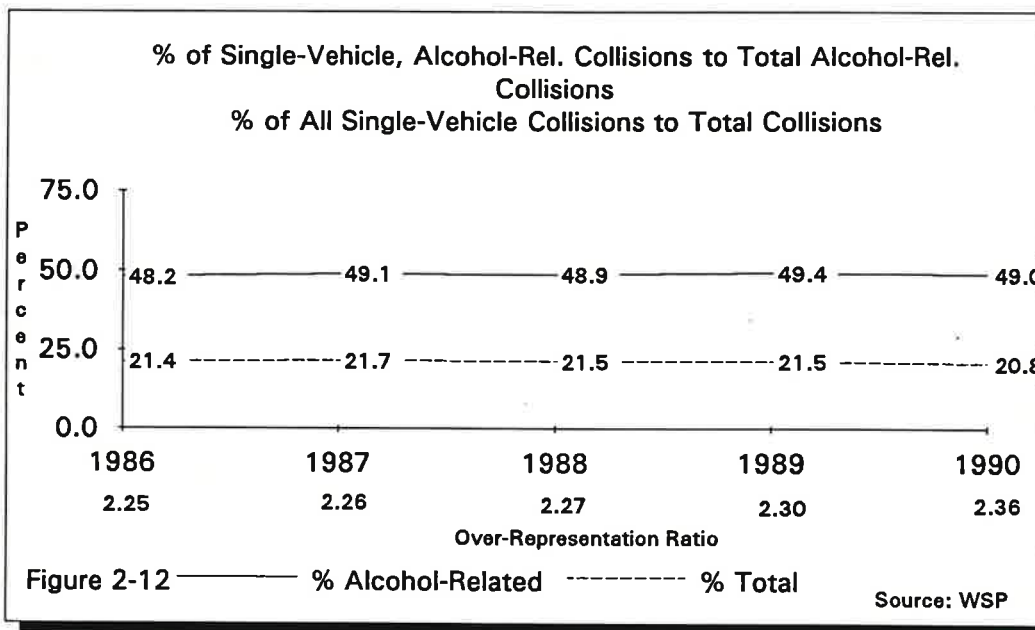

Alcohol-related collisions decreased in rural areas and increased in urban areas during 1990. During that year, 52.5% of the alcohol-related collisions occurred in rural areas and 47.5% occurred in urban areas (Figure 2-9). Multiple-vehicle collisions comprised 66.2% of collisions occurring in the urban areas (Figure 2-10), while single-vehicle collisions made up 64.0% of collisions occurring in rural areas (Figure 2-11).

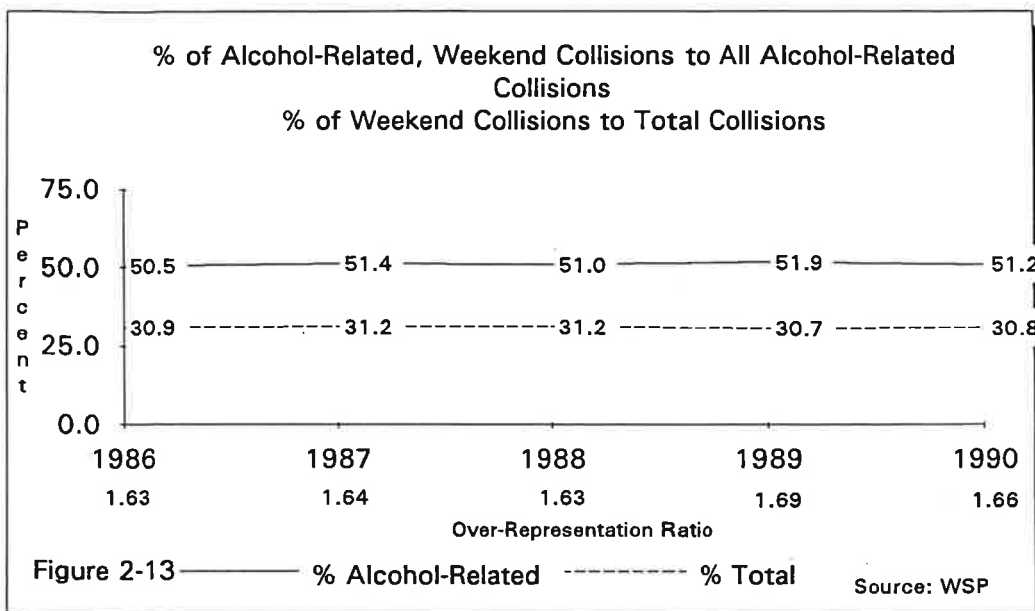

Single-Vehicle Alcohol-Involved Collisions

Figure 2-12 shows that over-involvement of single-vehicle alcohol-involved collisions are 2.36 times greater than recorded for all single-vehicles involved in all investigated collisions.

Weekend Alcohol Involvement

Figure 2-13 shows that the alcohol-related driver involvement in weekend collisions are 1.66 times greater than non-alcohol-related weekend collisions. A further breakdown compares the percentage of alcohol-involved collisions occurring on Friday and Saturday between the hours of 8 p.m. and 3 a.m. to the percentages of the total week's collisions occurring during the same time frame. This comparison shows that alcohol-related collisions were over-represented by 3.14 times during 1990. This is slightly above the over-representation ratio recorded for the previous four years (Figure 2-14).

Fatal Alcohol-Involved Collisions Occurring At Night

The ratio of all nighttime fatal crashes involving alcohol to all alcohol-related fatal crashes decreased during 1990 as compared to the previous two years. All nighttime fatal crashes composed 51.0% of the year's total fatal crashes, while alcohol-related nighttime fatal crashes decreased to 71.0% of all nighttime fatalities. Alcohol-related fatal crashes at night over-represent all nighttime fatal crashes by a ratio of 1.39, down from the previous two-year period ratio (Figure 2-15).

Drinking/DWI Drivers In Fatal Collisions By Roadway Type

Of all drivers involved in fatal crashes in 1990, 37.9% had been drinking prior to the crash. This is up from the 35.0% recorded for the previous year, but down substantially from the 47.6% recorded for 1981 (Figure 2-16). During 1990, the ratio of drinking drivers involved in traffic collisions compared to all drivers involved decreased from 18.2 drivers per 100 in 1981 to 10.8 per 100 in 1990 (Figure 2-17).

BAC Data

The total frequency of particular blood-alcohol concentration (BAC) levels in fatal and serious injury collisions for 1990 by age group is presented in Table 2-4. The 16-20 age group evidenced the greatest incidence of involvement for .05-.19 BAC. At the .10-.19 BAC range, the 21-24 age group, the 25-29 age group and the 30-34 age group had the highest frequency of occurrences. The higher BAC level (.20-.24) were displayed by the 25-29 age group and the 30-34 age group (Table 2-4).

Roadway Type By Day of Week/By Year

An analysis of roadway type by day of occurrence for fatal and serious injury collisions indicates that Saturdays recorded the highest incidence on all types of roadways. Sunday was the second highest alcohol involvement on county roads, while city streets recorded the second highest involvement on Fridays (Table 2-5). Figure 2-18 compares alcohol-related fatal and serious injury collisions by roadway type for the last three years.

Alcohol-Related Collisions By Month

Table 2-6 shows figures of persons killed and injured in alcohol-related collisions by month. The summer months of June, July, August and September recorded 37.4% of persons injured in alcohol-related collisions. Forty-five persons were killed in alcohol-involved collisions during the month of July 1990 .

Table 2-6

III. Youth Involvement

The number of youthful drivers (24 years of age and younger) involved in traffic collisions has decreased for the fourth consecutive year. The number of youth-involved collisions during 1990 was 57,545, down 5.7% from the previous four-year average. However, fatal and injury collisions increased 6.0% and 16.3% respectively. The total collision rate (youthful drivers involved per 100 licensed) increased 1.53% over 1989 but was down 3.7% from the previous four-year average (Table 3-1).

Youthful Drivers In Collisions By First Harmful Event

In 1990, 75.9% of youthful drivers involved in collisions collided with other moving vehicles. This type of collision resulted in the greatest percentage of fatal crashes (40.6%) and injury collisions (73.4%). Single vehicle collisions with fixed objects were the second highest percentage of driver involvement in total, fatal and injury collisions at 14.7%, 31.8% and 15.7% respectively (Table 3-2).

Table 3-2

| COLLISIONS INVOLVING YOUTHFUL DRIVERS By First Harmful Event - 1990 | | | | | | |

Collision Involvement By Driver Age

The 16-20 year old age group was involved in 15.9% of all collisions. This group makes up 6.8% of the state's licensed drivers, which creates an over-representation ratio of 2.35, down slightly from the previous four years (Figure 3-1). The 21 to 24 year age group also decreased its over-representation ratio from 1.63 in 1989 to 1.60 in 1990 (Figure 3-2). The 25-29 year age group recorded an over-representation ratio of 1.27, up from the previous four years (Figure 3-3). All older age groups were under-represented (Figures 3-4, 3-5).

Collision Severity By Area For Youthful Drivers

Sixty percent of all youthful driver collisions occurred in urban areas, up from each of the previous four years (figure 3-6). Of the youthful injury collisions, 56.4% occurred in urban areas (Figure 3-7). Of the youthful driver fatal crashes, 78.5% occurred in rural areas, down slightly from the 1989 percentage, but up from the years 1986 through 1988 (Figure 3-8).

Youthful Driver Involvement By Day Of Week

The highest number of fatal crashes involving youthful drivers in both rural and urban areas occurred on Saturday. Regarding total crashes, however, most youthful driver involvement occurred on Friday in both rural and urban areas (Figures 3-9, 3-10).

Youthful Driver Involvement By Time

Most collisions involving youthful drivers occurred between 3 p.m. and 6 p.m. in both urban and rural areas (Figure 3-11). Most fatal collisions involving youthful drivers occurred between midnight and 3 a.m. in both urban and rural areas (Figure 3-12).

IV. Safety-Restraint Use

Most restraint usage rates in this summary are based upon data collected by enforcement officers during collision investigations. When direct observation is impossible, the officer's only alternative is to question those involved as to their seat belt use. Since Washington has a mandatory seat belt use law, the human tendency to report compliance, when in fact no belt was worn, artificially inflates the usage rate. Rates based upon observational studies, on the other hand, tend to be somewhat low due to difficulties in viewing belt use. Table 4-1a displays results of observational studies performed during the past several years. Each year's fatality and disabling injury rate are also displayed.

Table 4-1a

*Fatalities/disabling injuries per 100,000,000 miles of travel

**1990 observational survey not performed; May 1991 survey result: 66%.

During 1990, 84.9% of the occupants involved in investigated traffic collisions indicated that they were wearing a safety restraint at the time of the crash. The data indicated that out of 207,595 occupants involved in total investigated collisions, 176,241 were using restraints. The usage rate has been increasing since 1981, when only 15.9% of occupants were belted. The highest increase occurred in 1986 when the mandatory seat belt law was implemented (Table 4-1). Last year, 458 occupants who were not using any type of restraint died and 2,450 were seriously injured. Based on 1989 investigated collision data, it is estimated that an occupant who does not "buckle up" is fifteen times as likely to be killed and over four-and-one-half times as likely to be seriously injured than one who does (Table 4-2).

*Excludes cases where injury severity was not stated or where restraint use was unknown.

**Included with Restraints Used Category.

+ Does not include 35 occupants where the injury data was unknown.

Restraint Use By Sex And Age

In 1990 investigated collisions, 89.4% of the female drivers used their restraints, while 85.5% of the male drivers used theirs. This represents an increase in both groups over 1989. Male passengers used the restraints at a 76.4% rate, while female passengers used them at an 83.4% rate (Table 4-3). The 0-5 age group had the highest restraint use rate of any age group at 89.1%, followed by the 35-64 group with a usage rate of 89.0%. Both groups increased their usage from 85.8% during 1989.

The 16-19 year-old group, which has recorded low usage rates in past years, recorded the lowest rate at 79.7%. All groups showed increases in their respective usage rates when compared to previous years (Table 4-4). One-year-old infants recorded the highest individual age rate, 92.8%, and the 65 and over group was next at 90.5%. Fifteen-year-old occupants only buckled up at a 73.4% rate (Table 4-5).

Restraint Use By Driver Occupation

Law enforcement officers and military personnel recorded the highest restraint usage rates for 1990 with 96.6% and 94.4% respectively. Farmers and farm laborers recorded the lowest rate with 72.1% (Figure 4-1).

Restraint Use By County

King County recorded the highest usage rate with 89.1%, up from 83.7% the previous year. Garfield County not only had the lowest usage rate of any county for 1990, but also recorded a substantial decrease from its 65.7% of 1989. San Juan and Asotin Counties recorded 52.7% and 54.9% respectively, and were also down from the previous year's rates (Table 4-5b).

Table 4-5b

Restraint Use By Road Type

The interstate system had the highest safety-restraint usage rate by vehicle occupants at 90.4%. Occupants of vehicles traveling on city streets and on state routes recorded rates of 85.8% and 85.0% respectively. The occupant usage rates in 1990 increased on all types of roadways, particularly in the "all other" group, which includes forest service roads and recreational roads that are open to the public; that category jumped from 60.9% in 1989 to 68.2% in 1990. This remains the lowest rate of all the roadway types, however (Table 4-6).

Table 4-6

| RESTRAINT USAGE IN COLLISIONS By Functional Class of Roadway | | | | | |
|---|-------|-------|-------|-------|-------|
| Functional Class | 1990 | 1989 | 1988 | 1987 | 1986 |
| Interstate | 90.4% | 87.0% | 86.5% | 84.6% | 66.8% |
| Other State Routes | 85.0% | 81.5% | 79.8% | 82.0% | 56.0% |

Restraint Use By Vehicle Type

Examination of safety-restraint use by vehicle type reveals that occupants of heavy trucks recorded the highest increase from the previous year, going from a 75.8% rate in 1989 to an 82.2% rate in 1990. Occupants of passenger vehicles had the highest usage rate with 86.0% (Table 4-7). In 1990, 94.7% of the occupants were using safety restraints in state government registered vehicles, up substantially from the 81.0% rate of the previous year. Usage rate by county government vehicle dropped to a 78.6% rate, the lowest in this group (Table 4-8).

Table 4-7

| RESTRAINT USAGE RATE BY OCCUPANTS IN COLLISIONS By Type of Vehicle | | | | | |
|---|-------|-------|-------|-------|-------|
| Type of Vehicle | 1990 | 1989 | 1988 | 1987 | 1986 |
| Passenger Car | 86.0% | 82.1% | 81.6% | 78.9% | 56.6% |
| Light Trucks | 82.5% | 78.0% | 76.2% | 73.1% | 48.8% |
| Heavy Trucks | 82.2% | 75.8% | 71.7% | 67.7% | 49.9% |
| All Others | 74.6% | 73.2% | 68.3% | 69.5% | 52.9% |

Usage Rate By Proximity

Drivers residing within 15 miles of the collision scene recorded the lowest safety-restraint usage rate with 86.7%. Drivers residing in another state recorded the highest rate with 88.7%. All categories continued to record increases in restraint usage over previous years (Table 4-9).

Table 4-9

| RESTRAINT USAGE RATE IN COLLISIONS BY PROXIMITY OF DRIVER RESIDENCE Five-Year Comparison | | | | | |
|---|-------|-------|-------|-------|-------|
| Residence Proximity | 1990 | 1989 | 1988 | 1987 | 1986 |
| Resided within 15 miles of collision | 86.7% | 82.7% | 81.9% | 79.7% | 55.5% |
| Resided over 15 miles | 87.6% | 84.4% | 84.0% | 80.4% | 58.1% |
| Residing in other state | 88.7% | 85.6% | 83.4% | 79.1% | 60.0% |

Source: WSP, WSDOT

Restraint Use By Seat Position

Drivers continued to be the most frequent users of safety restraints, with an 86.8% rate, followed by occupants riding in the right back seat with 82.8% and occupants in the right-front with 82.5%. Mid-front and mid-back occupants continue to have the lowest rates, except for the "other" position, which includes positions in non-designated areas (back of station wagons, truck beds, etc.) (Table 4-10). Children aged 0-4 sitting in the left-back, right-back, and middle-back seats recorded the highest usage rates at 97.6%, 94.4% and 92.9% respectively. The 5-9 age group also used safety-restraints most frequently in the right-back position, followed by the right-front and then left-back. Right-front occupants 65 and over recorded the highest usage rate during 1990, 91.3%, followed by drivers 65 and over with a 90.6% use rate (Table 4-11).

Table 4-10

| RESTRAINT USAGE RATE BY OCCUPANT SEAT POSITION Five-Year Comparison | | | | | |
|--|-------|-------|-------|-------|-------|
| Occupants | 1990 | 1989 | 1988 | 1987 | 1986 |

Restraint Use By Severity Of Collision

Of the 623 occupants killed in vehicle collisions in 1990, 458 (73.5%) were not using restraints. Of the 5,375 persons sustaining disabling injuries in investigated collisions, 45.6% were using no restraints. Of occupants who were reported to be using restraints in collisions, 88.9% sustained no injuries (Table 4-12).

Table 4-12

Restraint Use By Sobriety

Of all drivers involved in 1990 collisions, those who had been drinking were less likely to be wearing restraints than those who had not been drinking. The restraint usage rate for the non-drinking category was computed at 85.1%. Those drinking had a much lower rate, with 44.5% for drivers under the influence of intoxicating liquor (DUI) and 53.4% for drivers who had been drinking (HBD) (Figure 4-3).

V. Motorcycle Collisions

Motorcycle fatalities, injuries and collisions decreased during 1990 compared to 1989 and also to the previous four-year baseline average. Motorcycle registration dropped from 118,685 during the four-year average to 103,537 in 1990, a decrease of 12.76%. The 1990 total collision registration rate of 2.09 per 100 registered motorcycles was down 18.08% from the four-year baseline average. The fatal registration rate (deaths per 1,000 registered motorcycles) dropped 11.10% compared to the four-year average. The total killed in motorcycle crashes for 1990 was 62, which was down 23.22% from the baseline average of 81 deaths per year. Fifty-five motorcycle drivers, 5 motorcycle passengers, and 2 pedestrians were killed in motorcycle crashes in 1990 (Table 5-1).

Motorcycle Collisions By Age Group

The 16-18 year-old motorcycle rider continues to be over-represented in the accident population compared to the percentage of licenced motorcycle drivers comprising that age group. The 16-18 age group was involved in 7.2% of total collisions, but they comprise less than one-half of one percent of motorcycle-endorsed drivers. The 25-29 year-old motorcycle riders were involved in the largest percentage of fatal, injury, and total reported collisions (16.7%, 17.9% and 17.6% respectively). This group made up only 11.5% of all licensed operators with motorcycle endorsement. Operators in the age 30 and older group contributed to 42.1% of motorcycle collisions, but they made up 81.9% of all licensed operators with motorcycle endorsement (Table 5-2).

Motorcycle Collisions By Location

Forty-eight fatal motorcycle collisions occurred in rural areas, while 12 occurred in urban areas of the state. This was an increase of 1 for the rural areas and a decrease of 11 in the urban areas compared to 1989. The urban areas recorded 1,011 injury collisions in 1990 while the rural areas recorded 829 for a total of 1,840, which was down 331 from the previous year. Total reported collisions totalled 2,167 for 1990. The urban/rural breakdown was 1,207 urban and 960 rural. Both areas recorded decreases from the previous year (Table 5-3).

Motorcycle Collisions By Type Of Road

During 1990, the greatest number of persons killed in motorcycle crashes (26) were on county roads. City streets, however, recorded the most collisions (1,128) and the most injuries (1,117). On state routes, 281 motorcycle crashes occurred with 21 persons killed and 308 persons injured. On the interstate system, 4 motorcyclists were killed and 138 were injured out of 143 reported collisions during 1990 (Table 5-4). The total frequency of motorcycle collisions occurring on city streets, county roads and all state routes decreased during 1990, continuing a four-year trend (Figure 5-1).

Motorcycle Violations

Speed too fast for conditions was the most noted violation in motorcycle collisions with drivers of all age groups, contributing to 26.6% of the year's motorcycle violations in investigated collisions. This violation contributed to 29.4% of the 30-34 year-old operator and 27.6% of the 20 and younger operator violations. Driving while under the influence was the second most prominent violation, contributing to 15.9% of total motorcycle driver violations in collisions. This violation comprised 26.4% of all 30-34 year-old operator violations and 21.3% of 35-44 year-old operator violations (Table 5-5).

Motorcycle Collisions By First Harmful Event

The most common first harmful event in single-motorcycle collisions was overturning. This event predominated in collisions for all age groups. In multiple-vehicle collisions involving motorcycles, rear-end collisions were the most prevalent at 14.5% followed by angular direction collisions with 14.2%. Collisions occurring while entering or leaving a driveway contributed to 11.4% of the total (Table 5-6).

Motorcycle Helmet Use In Collisions

The mandatory helmet use law was enacted on July 1, 1990. Table 5-7 contains motorcycle collision statistics in a format enabling comparison of the last six months of 1989 (when the helmet law was not in effect) with the last six months of 1990 (when the law was in effect). From the last six months of 1989 to the same period in 1990, the rate of helmet use in collisions almost doubled, increasing from 42.0% to 81.5%.

Comparing those same time periods, the percentage of motorcyclist fatalities in collisions decreased from 2.4% in 1989 to 2.2% in 1990. The percentage of motorcyclist disabling injuries was 30.6% in the last half of 1989, decreasing to 24.1% in the last half of 1990. Motorcyclist non-disabling injuries and non-injuries were 65.6% for the last six months of 1989, increasing to 72.2% for the last six months of 1990 (Table 5-7).

* Mandatory motorcycle helmet use law enacted July 1, 1990.

Motorcycle Collisions By Month, Day and Hour

The summer months (June-September) of 1990 recorded the greatest percentage of motorcycle collisions. Twenty percent (20%) of fatalities occurred during the month of August, followed by 16.7% in July and 13.1% in September (Figure 5-3). Friday and Saturday experienced the greatest numbers of motorcycle collisions compared to other days of the week. This pattern follows the previous four-year average for days of the week (Figure 5-4). Breaking down motorcycle collisions by hour of the day reveals that weekday hours from 2 p.m. to 10 p.m. were the most hazardous period of the day. The noon to 10:00 p.m. time period was the highest risk period for weekend motorcyclists (Figure 5-5).

VI. Pedalcycles

Total pedalcycle collisions decreased 4.8% from the previous four-year average in 1990. The number of pedalcyclists killed totaled 14 in 1990, up 1 from the previous four-year average and up 6 from 1989. The number injured decreased 95, or 6.5%, from the previous four-year period, but was up 31 from the 1989 total (Table 6-1).

Table 6-1

Pedalcycle Collisions By Rural/Urban Areas

Urban areas recorded 72.4% of the total reported car-pedalcycle crashes, up slightly from the previous four years. The rural areas of the state accounted for 27.6% of car-pedalcycle crashes, which continued a three-year downward trend (Figure 6-1).

Pedalcyclists Killed and Injured By Age

In 1990, 28.0% of pedalcyclists killed and injured were between 10 to 14 years old; this was the highest representation of any age group. The new highest representation was the 25-34 age group with 16.1% of total collisions, a 24.4% increase from the previous four year average. The 35-44 age group recorded the highest percentage of increase in pedalcycle deaths and injuries, 46.6% over the previous four-year average and 39.1% over 1989 (Table 6-2).

Pedalcyclists Killed and Injured By Month

The months of May through September accounted for 62.7% of all persons killed and injured in pedalcycle-related collisions in 1990 (Figure 6-2).

Pedalcycle Collision Rates By City Population

The city of Port Angeles recorded the highest pedalcycle collision rate in the state during 1990 with 67.76 collisions per 100,000 population. Bellingham was second highest in this category with 59.42, followed by Seattle with 54.54 and Walla Walla with 52.87 collisions per 100,000 population (Table 6-3).

VII. Pedestrians

During 1990, 80 pedestrians were killed and 1,861 were injured in the state. This was a decrease of 18.8% in the number killed, and an increase of 1.3% in the number injured compared to the previous four-year average. There were similar numbers of pedestrians killed in rural and urban areas, 42 in rural areas and 38 in urban areas. However, many more pedestrian injuries occurred in urban areas than in rural areas, with 1,398 in urban areas and 463 in rural areas (Table 7-1).

Pedestrians Killed and Injured By Age

Seven pedestrians in the age group 5-9 were killed. Ten pedestrians killed were nine years of age or younger. By contrast, 17 pedestrians killed were 75 year of age or older. A total of 28 pedestrians killed were 65 years or older. The largest decrease in pedestrian deaths was in the 20-44 age group, from 40 deaths in 1989 to 21 in 1990. The 10-19 year-old age group experienced an even greater reduction, recording 5 deaths in 1990 compared to 18 in 1989. The total number of pedestrians killed in the state during 1990 was 81, down 29 from 1989's total of 110, and down 16 from the baseline average (Table 7-2). Pedestrian injuries have stayed relatively constant during the past four years. The largest percentage decrease occurred in the 0-4 age group which experienced a 14.3% reduction. The biggest increase in pedestrian injuries was in the 45-54 age group which was up 12.2% over the baseline period (Table 7-3).

* In all traffic collisions.

Pedestrian Collisions By City Population

Table 7-4 presents numbers and rates for 1990 pedestrian traffic deaths, injuries, and total collisions. For Washington cities of 15,000 population or more, Aberdeen had the highest rate for pedestrian fatalities at 12.07 per 100,000 population, based on 2 pedestrian deaths. Regarding pedestrian injuries, Seattle had the highest rate with 98.01 injuries per 100,000 population. Everett had the next highest rate with 78.62 and Wenatchee was third with 77.84. Seattle, Aberdeen and Everett had the three highest pedestrian collision rates with 94.91, 78.48, and 72.90 collisions per 100,000 population.

Actions Of Pedestrians Killed and Injured By Location

In urban areas, 50.1% of all pedestrians killed and injured were struck while crossing the roadway at an intersection, and 31.6% were killed or injured while crossing at a location other than at an intersection. Most pedestrians 65 years and older who were killed or injured in urban areas were crossing at an intersection (67.7%). Most pedestrians in the 0-4 age group who were killed or injured were crossing at a location other than an intersection (59.7%).

In rural areas, 36.4% of pedestrians killed and injured were in the 25-64 year-old age group. Of this group, 22.8% were struck while crossing the roadway at a non-intersection location. Pedestrians in the 5-14 age group accounted for 27.9% of those killed and injured in rural areas. Of this group, 56.7% were struck while crossing the roadway at a non-intersection location (Table 7-5).

Pedestrian Collisions By Day Of Week/Hour Of Day

Monday, Saturday and Sunday had the highest percentages of pedestrian fatalities by day of the week, with 17.7% occurring on Mondays and 16.5% occurring on both Saturdays and Sundays. Wednesday, Thursday and Friday recorded the highest percentages of total pedestrian collisions with 16.9%, 16.0% and 18.0% respectively (Figure 7-1). By time, the period 3:00 p.m. to 6:00 p.m. had the highest percentage of both fatal and total pedestrian collisions with 20.3% and 30.6% respectively (Figure 7-2).

VIII. Heavy Trucks

In 1990, 6,725 heavy trucks (10,000 pound gross weight and over) were involved in collisions of which 81 were fatal. The heavy truck collision rate (collisions per 10,000 registered heavy trucks) was 582.3, down 7.98 from the baseline average. The fatal collision rate for heavy trucks was 7.0, which is equal to the baseline average and just under 1989's 7.1 rate (Table 8-1).

Table 8-1

Age of Drivers Involved in Heavy Truck Collisions

Of drivers involved in heavy truck collisions, 57.6% were 39 years of age or under. This group makes up 39.7% of all classified drivers, which creates an over-representation ratio of 1.45. The age group of 40 and over contributed to 42.4% of heavy truck collisions. They make up 60.32% of drivers with a classified license, creating a .70 under-representation ratio (Table 8-2).

Heavy Truck Defects

Defective brakes were present in 39.6% of the 530 trucks determined to have defective equipment in investigated collisions. Other defects included 11.3% with worn or smooth tires, 4.9% for tire punctures or blowouts, 4.9% for defective rear lights, 3.6% for defective steering mechanism and 35.7% for all other defects. Overall, there has been a 17.3% decrease in the number of defects reported in investigated collisions over the past several years (Table 8-3).

Location of Heavy Truck Collisions

During 1990, 56.4% of the collisions involving heavy trucks occurred in the urban areas, while 43.6% occurred in the rural areas of the state. These percentages have been fairly constant over the past five years (Figure 8-1). Regarding fatal heavy truck collisions, 78.9% occurred in rural areas. This figure has varied from a low of 72.2% in 1989 to a high of 81.0% in 1988 (Figure 8-2). Heavy truck injury collisions are more equally divided between urban and rural areas. In 1990, 51.6% of the heavy truck injury collisions occurred in rural areas and 48.4% occurred in urban areas (Figure 8-3).

Heavy Truck Collisions By Day of Week

Friday recorded the highest number of heavy truck collisions with 1,248, followed by Monday with 1,161. The weekend days of Saturday and Sunday had dramatically lower figures with 448 and 246, respectively. There was little change between 1989 and 1990 (Figure 8-4).

Heavy Truck Collisions By Hour Of Day

The peak heavy truck collision period was from noon to 3:00 p.m. during 1990, which was true for both fatal and total heavy truck collisions. Total collisions showed increases from 6:00 a.m. until 3:00 p.m. (Figure 8-5).

Light and Heavy Truck Collisions

Figure 8-6 shows the collision percentages of light trucks (gross weight of under 10,000 pounds) as compared to heavy trucks. During 1990, 90.7% of all truck collisions involved light trucks. The percentage of light truck registrations has been gradually increasing over heavy truck registrations over the past five years.

Heavy Truck Collisions By First Harmful Event

Heavy trucks were involved in 4,769 collisions involving other moving motor vehicles. This figure represents 73.5% of all heavy truck collisions in 1990. In addition, heavy trucks were involved in 423 collisions in which the other vehicle was parked, and in 755 collisions with fixed or other objects. All of the above events were more numerous in 1990 than in 1989. There were 321 collisions in which a truck overturned during 1990, which was 58 fewer occurrences than in 1989 (Table 8-4).

IX. Pupil Transportation

During the 1989-1990 school year, there were 325 school bus collisions reported, in which 103 school bus occupants were injured and one pedestrian was struck and killed by the school bus. Of the 103 school bus occupants who were injured, 85 were pupils, 17 were drivers, and 1 was an occupant other than a student. Nine of the injuries were judged to be a major injury, 34 were minor injuries, and 66 were possible injuries (i.e. complaints of pain, etc.). School bus registration totalled 6,906 vehicles, and total travel was computed at 78.1 million miles during the school year (Table 9-1). The school bus collision rate for the 1989-1990 school year was computed at 0.42 collisions per 100,000 miles traveled. The 1989-1990 rate was the lowest since 1983-1984 (Figure 9-1).

X. Contributing Driver Violations

Driving while under the influence of intoxicating liquor and/or drugs made up 8.3% of the violations noted in all investigated crashes and a much larger 31.2% of all violations noted in fatal crashes. Failure to yield the right of way was the second most noted violation in all collisions, with 21.4%, but made up only 5.9% of violations noted in fatal collisions. Exceeding a reasonable safe speed contributed to 19.0% of the violations noted in all investigated collisions and 16.3% of fatal collisions. Exceeding the posted speed accounted for only 3.7% of violations noted in all collisions, but for fatal collisions 13.4% of violations noted were in this category (Figure 10-1).

XI. Senior Driver Involvement

In 1990, 28,103 senior drivers (55 years and older) were involved in 25,907 reported collisions. There were 142 fatal collisions involving 157 senior drivers and 10,059 injury collisions involving 10,937 senior drivers. These figures indicate that senior driver involvement in 1990 increased over the previous four-year baseline period 6.3% in total collisions, 1.5% in fatal crashes and 9.5% involved in injury collisions. The number of driver licenses issued to seniors (781,620) increased 4.0% from the baseline period. The total collision rate for senior drivers (total collisions per 1,000 licensed senior drivers) was 3.60 for 1990, up 2.1% from the baseline period (Table 11-1).

Table 11-1

Senior Driver Collisions By First Harmful Event

Of all collisions involving senior drivers in 1990, 87.5% were with other moving vehicles. This type of collision accounted for 64.1% of fatal crashes and 85.8% of injury collisions. Single-vehicle collisions with fixed or other objects led to the next highest percentages of senior driver involvement in total, fatal and injury collisions, at 6.1%, 17.6% and 6.8% respectively. Collisions with pedestrians and bicycles contributed to only 1.8% of total senior driver collisions, but resulted in 11.3% of fatal and 4.3% of injury collisions involving senior drivers (Table 11-2).

Table 11-2

Contributing Circumstances In Senior Driver Collisions

Failure to yield right of way contributed to 49.8% of all driver violations in the 75 years and older age group. This violation was the leading contributing circumstance for all drivers 55 years and older in collisions. Speed too fast for conditions was the second leading driver violation for senior drivers ages 55-59, 60-64 and 65-69, with 16.0%, 13.2% and 12.1% respectively. Disregarding traffic signals/signs was second highest violation for the 70-74 and for the 75 and older age groups with 10.9% and 10.8%, respectively (Table 11-3).

Table 11-3

| SENIOR DRIVER INVOLVEMENT IN INVESTIGATED COLLISIONS Contributing Circumstances By Age Group - 1990 | | | | | | | | | | |

Senior Driver Collisions By Age Group

Figures 11-1 through 11-5 show that each senior driver age group has been under-represented in collisions compared to their percentage of licensed drivers. Furthermore, these under-representation rates have been evident for the last five years. To illustrate, the 55-59 age group was involved in 3.49% of the reported collisions, but they constituted 5.28% of the total licenced drivers, creating a 0.66 under-representation ratio (Figure 11-1). The largest change in these ratios during the last five years has been a reduction in the 75 and older group's under-representation rate from 0.58 in 1989 to 0.51 in 1990 (Figures 11-1 through 11-5).

Senior Driver Collisions By Location and Severity

The urban/rural collision ratio involving senior drivers remained relatively constant during the past five years. In 1990, 66.0% of senior driver collisions occurred in urban areas and 34.0% occurred in rural areas (Figure 11-6). The senior driver injury collision urban/rural comparison has also remained fairly constant during the past five years. During 1990, 63.0% occurred in urban areas (Figure 11-7). The percentage of senior driver fatal collisions occurring in rural areas has been increased from 69.3% in 1986 to 77.7% in 1990 (Figure 11-8).

Senior Driver Collisions By Day Of Week And Location

In rural areas by days of the week, Thursday and Friday recorded the highest senior driver involvement in fatal collisions with 19.1% and 18.2% respectively. The week-end days of Saturday and Sunday recorded the fewest collisions in the rural areas with 13.2% and 10.7% of the week's totals (Figure 11-9). Urban areas followed a similar pattern in senior driver total collisions by day of the week. However, in senior driver fatal collisions, Tuesday and Wednesday had the highest percentages with 18.8% and 21.9% respectively (Figure 11-10).

Senior Driver Collisions By Time Of Day and Location

In rural areas, the greatest percentage of fatal crashes involving senior drivers (37.3%) occurred from 3:00 p.m. to 6:00 p.m. The greatest percentage of total collisions for senior drivers (28.5%) also occurred during that same time period (Figure 11-11). In urban areas, the greatest involvement in fatal crashes (28.1%) was also from 3:00 p.m. to 6:00 p.m. The noon to 3:00 p.m. time period contributed to the greatest share of total urban collisions (29.2%) closely followed by 3:00 p.m. to 6:00 p.m. (28.8%) (Figure 11-12).

XII. Vehicle Defects

Of all vehicles involved in investigated collisions in 1990, 3.6% were found to have contributory vehicle defects. The most common defect was worn or smooth tires, a defect found in 1,948 collision-involved vehicles. This number represents a 27.0% decrease in this category compared to the previous four-year average. Defective brakes, the second most frequent contributing defect, were found in 1,682 vehicles in collisions. This number represents a 10.5% decrease when compared to the four-year baseline average (Table 12-1).

Table 12-1

Appendix

**Data
Summary and
Problem
Analysis**

GLOSSARY

Collisions

Collision - A crash involving one or more motor vehicles on a trafficway which results in personal injury or death, or damage to any one person's property to an apparent extent of \$500 or more.

Fatal Collision - A traffic collision where one or more persons are killed or die within 30 days as a result of the collision. Also referred to as a "fatal."

Investigated Collision - A collision that has been investigated by a law enforcement officer. Data relating to alcohol involvement, contributing circumstances (driver violations) and vehicle defects are only collected from investigated collisions. Currently, most data on safety-restraint use is collected from investigated collisions.

Injury Classes

Fatal Injury/Fatality - A motor-vehicle, traffic-related injury that results in death. (There can be more than one "fatality" in a single "fatal collision.")

Disabling/Incapacitating Injury - An injury other than fatal that prevents the injured person from continuing normal activities.

Non-Disabling/Non-Incapacitating/Evident Injury - Any injury not disabling but evident to others at the scene.

Possible Injury - Any injury reported or claimed which is not a fatal, disabling, or non-disabling injury but includes momentary unconsciousness, limping, complaint of pain, nausea or hysteria.

Rates

Mileage Death Rate - Traffic deaths per 100 million vehicle miles of travel.

Vehicle Registration Death Rate - Traffic deaths per 10,000 vehicle registrations.

Injury Rate - Traffic injuries per 100 million miles of travel.

Calculations of Economic Loss - The calculable costs of motor vehicle collisions are wage loss, medical expense, insurance administration costs, and property damage. In 1989, the National Safety Council estimated the costs of all these items at \$290,000 for each death, \$32,000 for each disabling injury, \$8,300 for each non-disabling injury, \$2,600 for each possible injury, and \$3,000 for each property-damage-only collision.

Status

Occupant - Any person who is part of a motor vehicle in transport including drivers and occupants.

Driver - An occupant who is in actual physical control of a motor vehicle in transport.

Passenger - Any occupant of a motor vehicle other than the driver.

Pedalcyclist - Any occupant of a pedalcycle in transport, including bicycles and tricycles; not including motor driven cycles.

Pedestrian - Any person who is not an occupant or a pedalcyclist.

Senior Driver - Drivers 55 years and older.

Youthful Driver - Drivers 24 years of age and younger.

Location

Urban Area - Incorporated areas with population of 2,500 or greater.

Rural Area - Unincorporated or incorporated areas with population less than 2,500.

Trafficway - Any public roadway or highway used for motor vehicle travel.

Alcohol Involvement

DWI/Driving While Intoxicated - Driving while under the influence of alcohol (BAC of .10 and over) and/or when the investigating officer determines that the driver's driving ability was impaired by alcohol.

DWUI/Driving While Under the Influence - Same as DWI/driving while intoxicated.

HBD/Had Been Drinking - The investigating officer has determined that the driver had consumed some amount of alcohol and/or BAC test results greater than zero.

Vehicles

Motorcycle - Does not include mopeds or motorized bicycles

Heavy Truck - 10,000 pound gross weight and higher

Light Truck - Under 10,000 pounds gross weight

State Agency Abbreviations

DOL - Department of Licensing

OAC - Office of the Administrator for the Courts

OFM - Office of Financial Management

SPI - Superintendent of Public Instruction

WSP - Washington State Patrol

WSDOT - Washington State Department of Transportation

WTSC - Washington Traffic Safety Commission

Milestones in Washington Traffic Safety

- 1967:** Creation of Washington Traffic Safety Commission.
Mandatory motorcycle helmet law.
- 1968:** Implied consent law.
- 1971:** Habitual traffic offender law.
- 1973:** Speed limit reduced to 55 mph.
- 1975:** Negligent homicide statute.
Deferred prosecution statute.
- 1977:** Property damage reporting threshold raised to \$300 from \$100.
Motorcycle helmet law repealed.
- 1979:** DWI law modified to make .10% BAC illegal per se.
Mandatory day in jail for first DWI offense.
- 1980:** Fatality reporting threshold changed from one year to 90 days from date of collision.
- 1982:** "Day in Jail" changed to mean 24 consecutive hours.
Alcohol assessment and education/treatment required for DWI.
- 1983:** Vehicular homicide and assault statute.
Open container law for alcoholic beverages.
Mandatory child restraint law.
- 1984:** Mandatory child restraint law became chargeable traffic violation.
- 1986:** Mandatory seat belt law.
- 1987:** Mandatory seat belt law became a chargeable traffic violation.
Speed limit increased to 65 mph (60 mph for trucks) on rural interstate highways.
Motorcycle Helmets required for persons under 18 years of age.
Children under 5 years of age prohibited from riding on motorcycles.
Property damage reporting threshold raised to \$500 from \$300.
- 1988:** Vehicle registration cancelation for driving with a suspended drivers license.
- 1989:** Fatality reporting threshold changed from 90 days to 30 days from date of collision.
Youth under 19 years lose license for DWI for 90 days or until age 19 (whichever is longer).
- 1990:** Mandatory insurance required.
Mandatory motorcycle helmet law.
